

COUNTRY INDICATORS AND SDGS

TOTAL ENERGY SUPPLY (TES)

Total Energy Supply (TES)	2015	2020
Non-renewable (TJ)	997 637	976 253
Renewable (TJ)	69 808	75 391
Total (TJ)	1 067 445	1 051 643
Renewable share (%)	7	7

Growth in TES	2015-20	2019-20
Non-renewable (%)	-2.1	-3.8
Renewable (%)	+8.0	+13.7
Total (%)	-1.5	-2.7

Primary energy trade	2015	2020
Imports (TJ)	1 712 745	1 378 781
Exports (TJ)	817 254	497 248
Net trade (TJ)	- 895 491	- 881 533
Imports (% of supply)	160	131
Exports (% of production)	499	266
Energy self-sufficiency (%)	15	18

RENEWABLE ENERGY CONSUMPTION (TFEC)

Renewable TFEC trend

Consumption by sector	2015	2020
Industry (TJ)	9 408	20 693
Transport (TJ)	169	250
Households (TJ)	24 526	32 302
Other (TJ)	53 841	51 699

Renewable energy consumption in 2020

ELECTRICITY CAPACITY

Installed capacity trend

Renewable capacity in 2022

Net capacity change in 2022 (MW)

Net capacity change (GW)

Capacity utilisation in 2021 (%)

ELECTRICITY GENERATION

Generation in 2021	GWh	%
Non-renewable	37 201	97
Renewable	1 298	3
Hydro and marine	370	1
Solar	174	0
Wind	173	0
Bioenergy	581	2
Geothermal	0	0
Total	38 499	100

Per capita electricity generation (kWh)

Electricity generation trend

LATEST POLICIES, PROGRAMMES AND LEGISLATION

- 1 Technical Regulations of the Eurasian Economic Union "On requirements for transmission pipelines for the transportation of liquid and gaseous hydrocarbons" (TR EAEU 49/2020) 2021
- 2 Updated Nationally Determined Contribution (NDC) of the Republic of Belarus in the reduction of GHG by 2030 2021
- 3 On the promotion of the use of electric vehicles 2020
- 4 Air conditioners. Energy efficiency. STB 2480-2016 2016
- 5 Standards of maximum permissible concentrations of pollutants in the atmospheric air 2016

ENERGY AND EMISSIONS

Energy-related CO₂ emissions by sector

Elec. & heat generation CO₂ emissions in

Avoided emissions from renewable elec. & heat

Avoided emissions based on fossil fuel mix used for power

CO₂ emission factor for elec. & heat generation

Calculated by dividing power sector emissions by elec. + heat gen.

Distribution of solar potential

Distribution of wind potential

Biomass potential: net primary production

Indicators of renewable resource potential

Solar PV: Solar resource potential has been divided into seven classes, each representing a range of annual PV output per unit of capacity (kWh/kWp/yr). The bar chart shows the proportion of a country's land area in each of these classes and the global distribution of land area across the classes (for comparison).

Onshore wind: Potential wind power density (W/m^2) is shown in the seven classes used by NREL, measured at a height of 100m. The bar chart shows the distribution of the country's land area in each of these classes compared to the global distribution of wind resources. Areas in the third class or above are considered to be a good wind resource.

Biomass: Net primary production (NPP) is the amount of carbon fixed by plants and accumulated as biomass each year. It is a basic measure of biomass productivity. The chart shows the average NPP in the country (tC/ha/yr), compared to the global average NPP of 3-4 tonnes of carbon

Sources: IRENA statistics, plus data from the following sources: UN SDG Database (original sources: WHO; World Bank; IEA; IRENA; and UNSD); UN World Population Prospects; UNSD Energy Balances; UN COMTRADE; World Bank World Development Indicators; EDGAR; REN21 Global Status Report; IEA-IRENA Joint Policies and Measures Database; IRENA Global Atlas; and World Bank Global Solar Atlas and Global Wind Atlas.

Additional notes: Capacity per capita and public investments SDGs only apply to developing areas. Energy self-sufficiency has been defined as total primary energy production divided by total primary energy supply. Energy trade includes all commodities in Chapter 27 of the Harmonised System (HS). Capacity utilisation is calculated as annual generation divided by year-end capacity x 8,760h/year. Avoided emissions from renewable power is calculated as renewable generation divided by fossil fuel generation multiplied by reported emissions from the power sector. This assumes that, if renewable power did not exist, fossil fuels would be used in its place to generate the same amount of power and using the same mix of fossil fuels. In countries and years where no fossil fuel generation occurs, an average fossil fuel emission factor has been used to calculate the avoided emissions.

These profiles have been produced to provide an overview of developments in renewable energy in different countries and areas. The IRENA statistics team would welcome comments and feedback on its structure and content, which can be sent to statistics@irena.org.
