

# The Renewable Energy Potential (reV) Model

*A Geospatial Framework for Analyzing Energy Data*

Galen Maclaurin, Nick Grue, Anthony Lopez, Dylan Harrison-Atlas,  
Nick Gilroy, Michael Rossol, Grant Buster, Ricardo Oliveira, Evan  
Rosenlieb, Donna Heimiller, Rob Spenser, Trieu Mai, and Eric Lantz

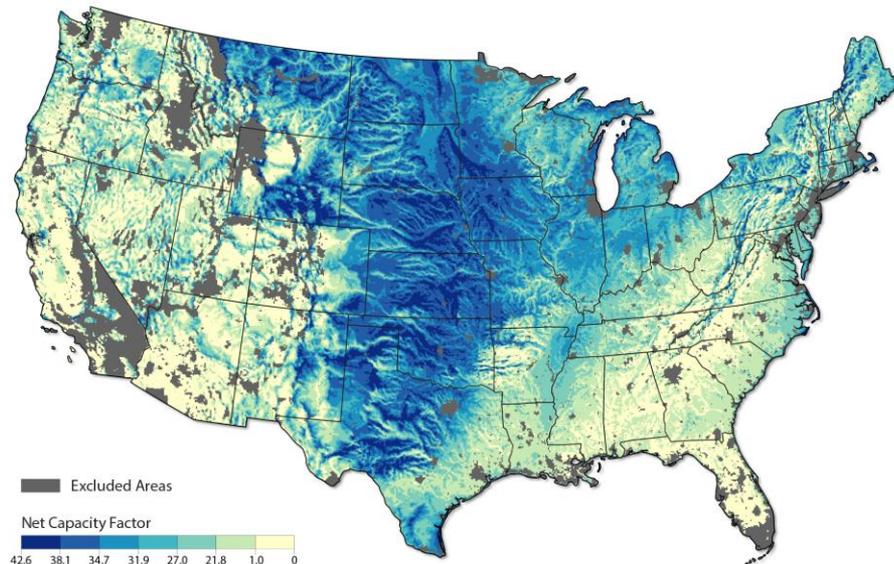

# The Renewable Energy Potential (V) Model

reV is a geospatial platform for assessing system performance, available capacity, distance to transmission, and total costs for potential wind and solar energy deployment at regional to continental scales.

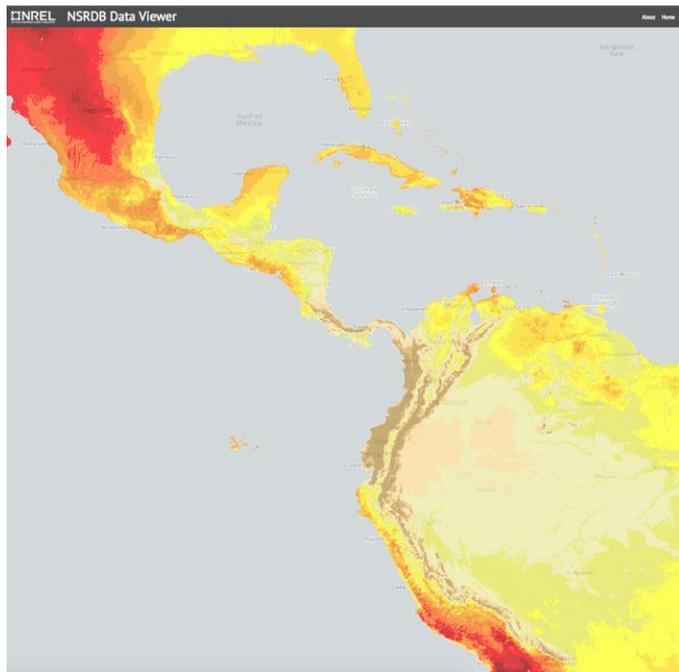

# The Renewable Energy Potential (V) Model

reV is a geospatial platform for assessing system performance, available capacity, distance to transmission, and total costs for potential wind and solar energy deployment at regional to continental scales.

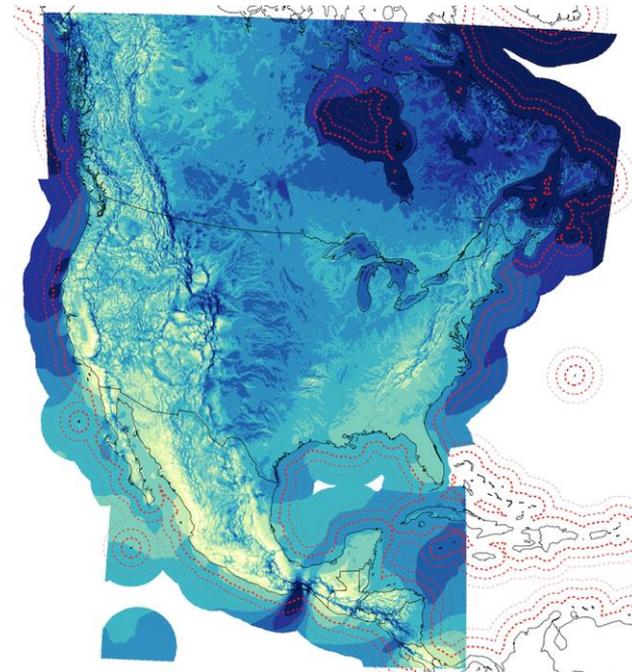

# Big Data: Spatiotemporal Solar and Wind Resource Data Sets

## National Solar Radiation Database (NSRDB)

- Temporal Range: 1998-2017
- Temporal Interval: 30-minute
- Spatial Resolution: nominal 4 km
- Spatial Extent: Western Hemisphere

[nsrdb.nrel.gov](http://nsrdb.nrel.gov)

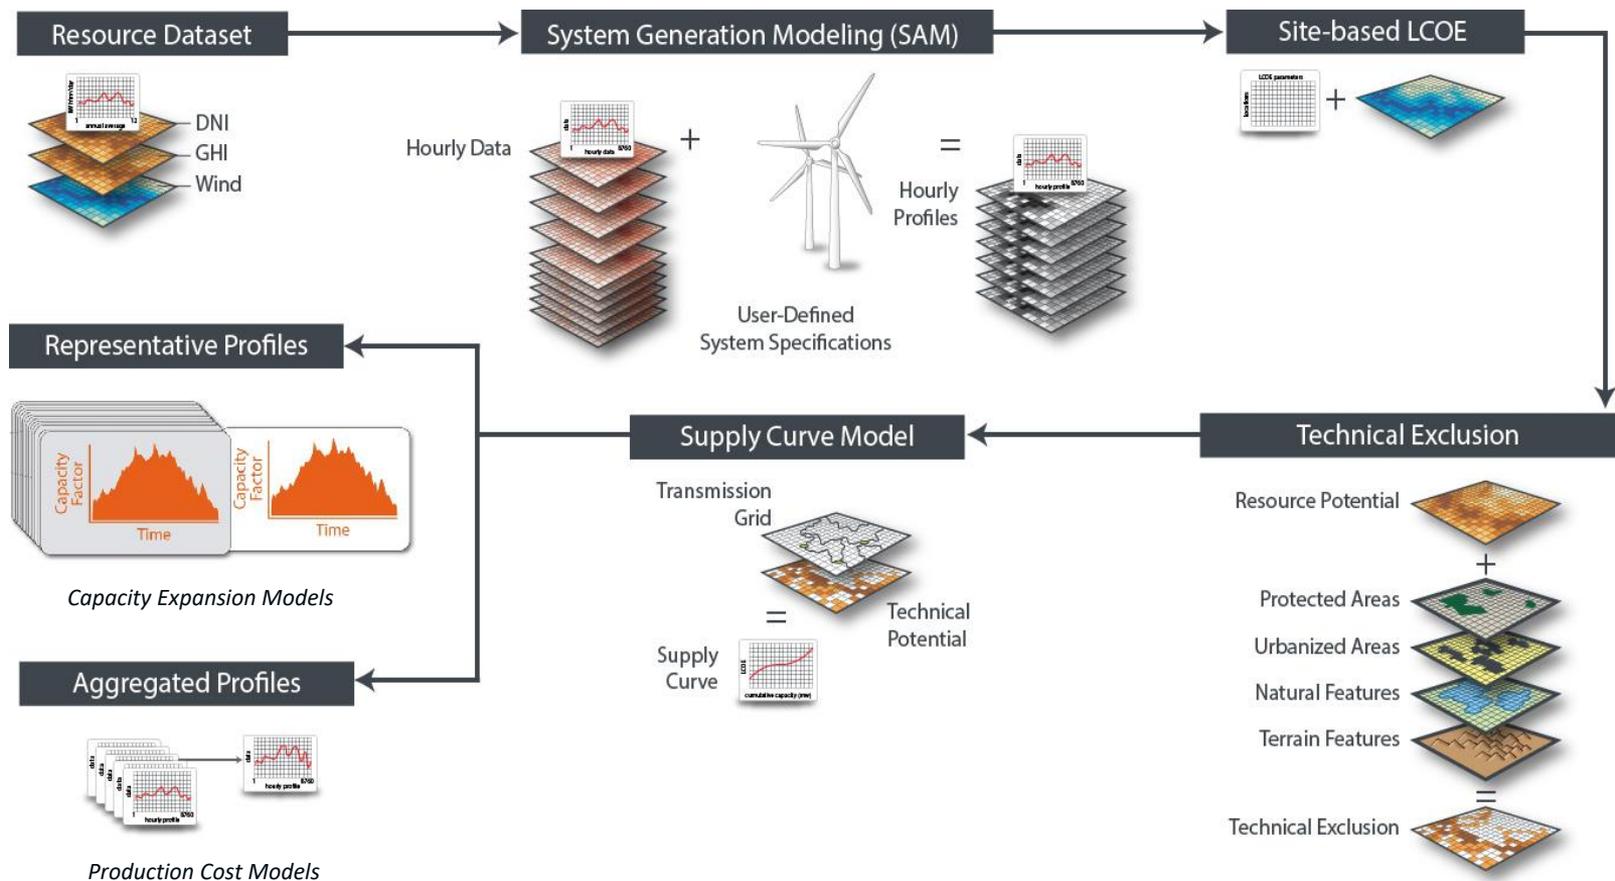

## WIND Toolkit

- Temporal Range: 2007-2014
- Temporal Interval: 5-minute or hourly
- Spatial Resolution: nominal 2 km
- Spatial Extent: North America

[www.nrel.gov/grid/wind-toolkit.html](http://www.nrel.gov/grid/wind-toolkit.html)

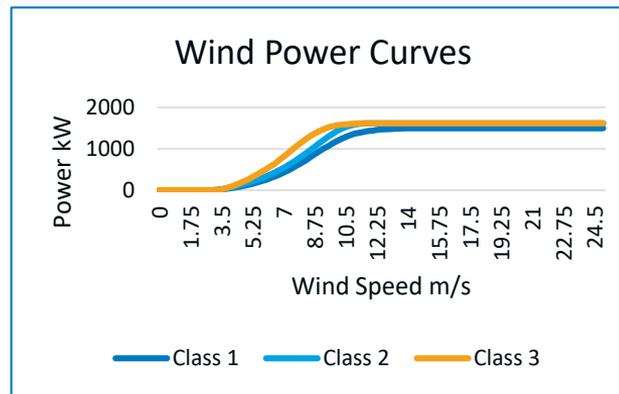

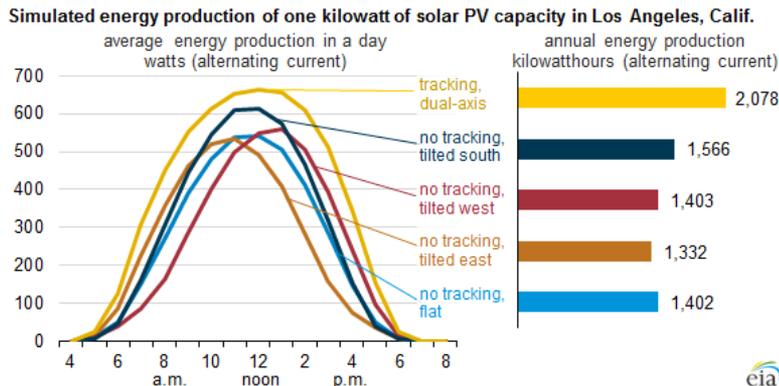

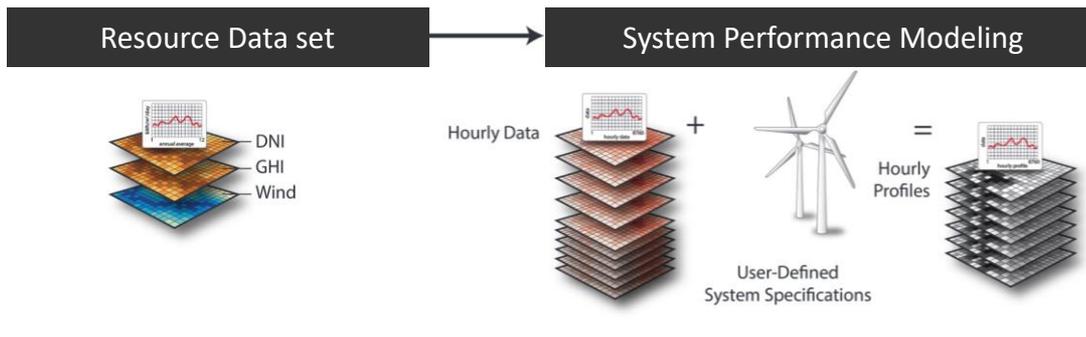

# reV Model Diagram

# Generation Potential

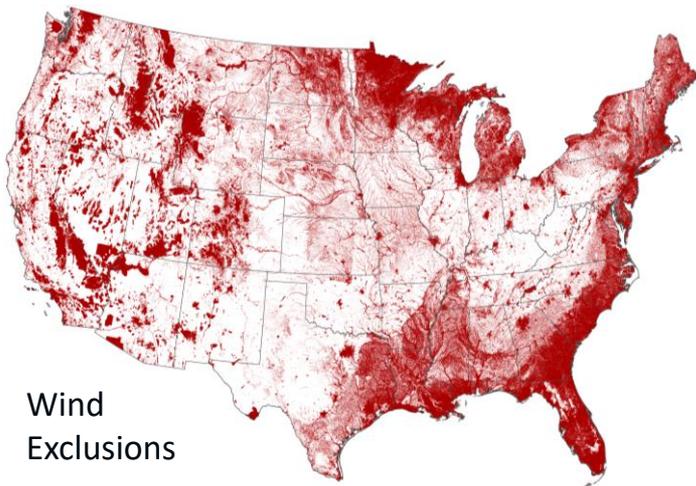

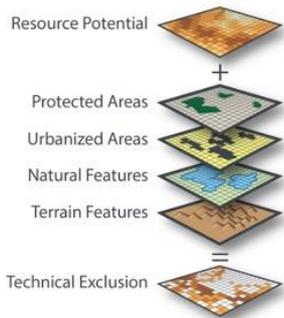

reV couples with NREL's System Advisor Model (SAM)\* to estimate time series capacity factors at the resource data resolution (e.g., 5-min, hourly)

\* [sam.nrel.gov](http://sam.nrel.gov)

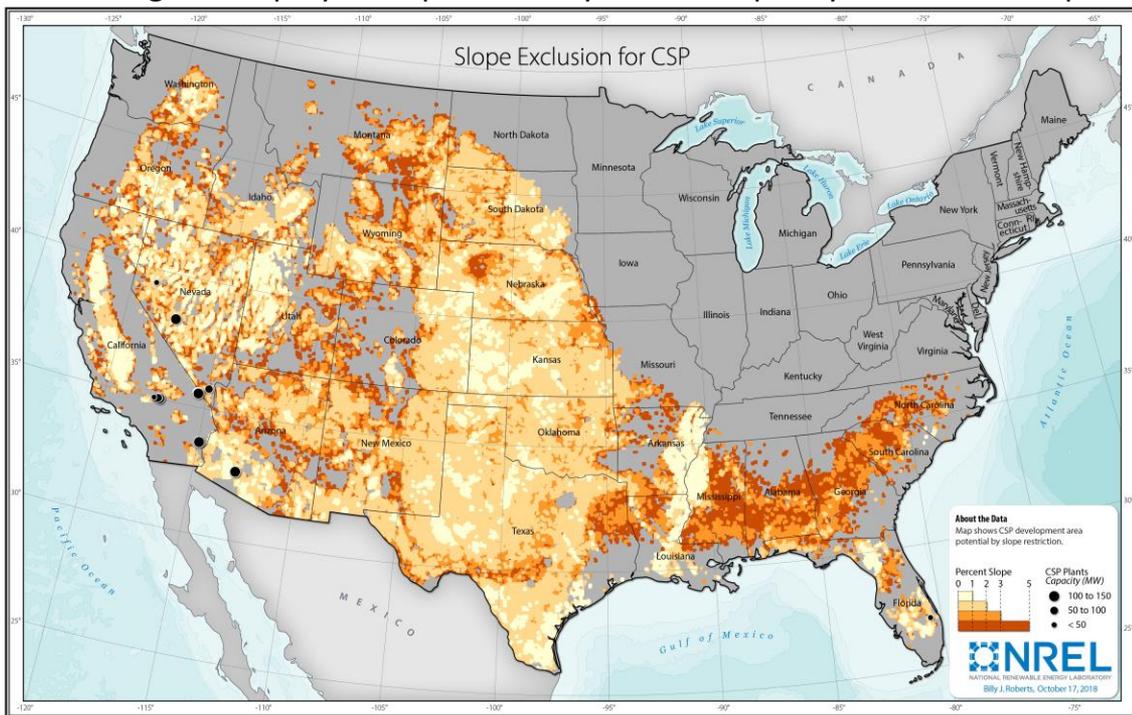

# Technical Exclusions

## Technical Exclusion

Wind Exclusions

## Limiting CSP deployment potential by resource quality and terrain slope

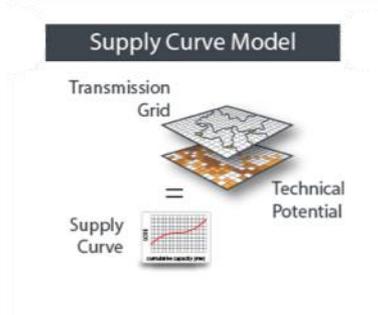

- Exclusions provide a means to model **siting considerations** and their **impact on supply**.
- Exclusions typically represent **sociopolitical, ecological, and technical constraints**.

# Supply Curve: Technical Potential

Annual Technical Potential=

Available area (km<sup>2</sup>) \* **Power Density (MW/km<sup>2</sup>)** \* Mean Capacity Factor \* 8760 hours

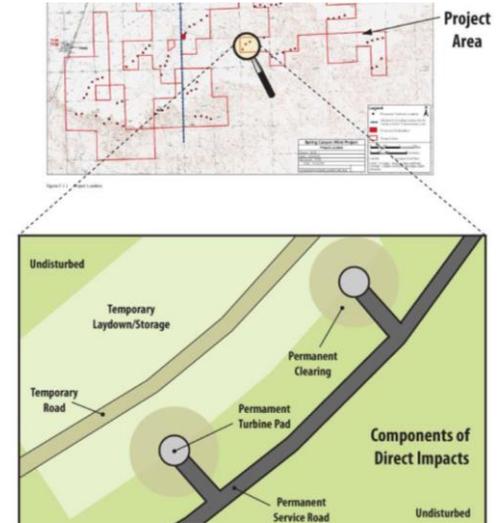

## PV Plant

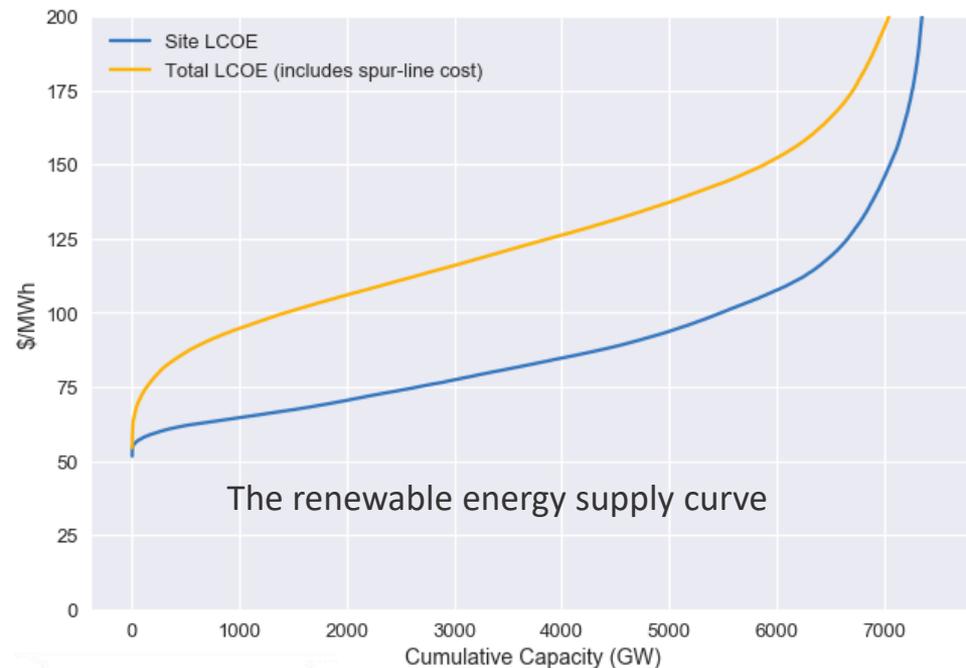

Typically 28-36 MW/km<sup>2</sup> Fixed-Tilt PV

## Wind Plant

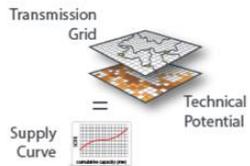

Typically 3-5 MW/km<sup>2</sup> Wind Plant

# Supply Curve: Levelized Cost of Transmission (LCOT)

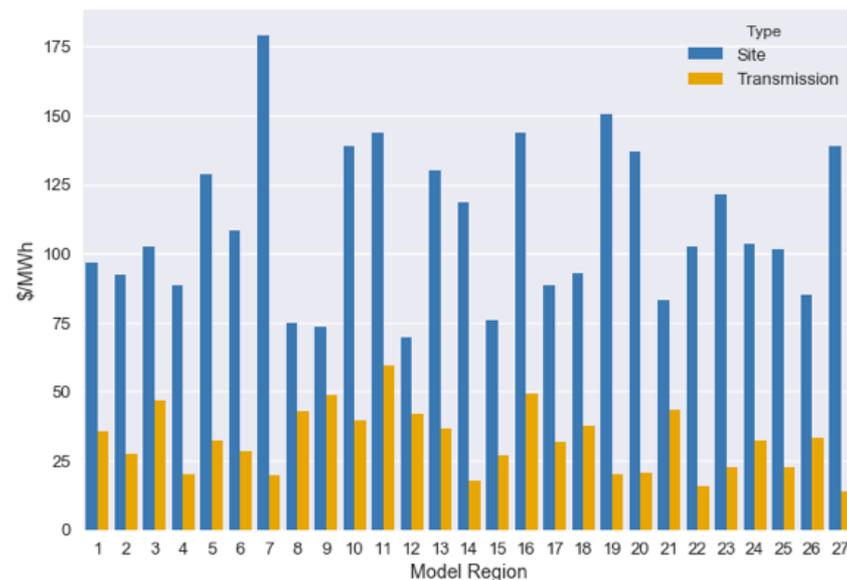

The renewable energy supply curve

## Supply Curve Model

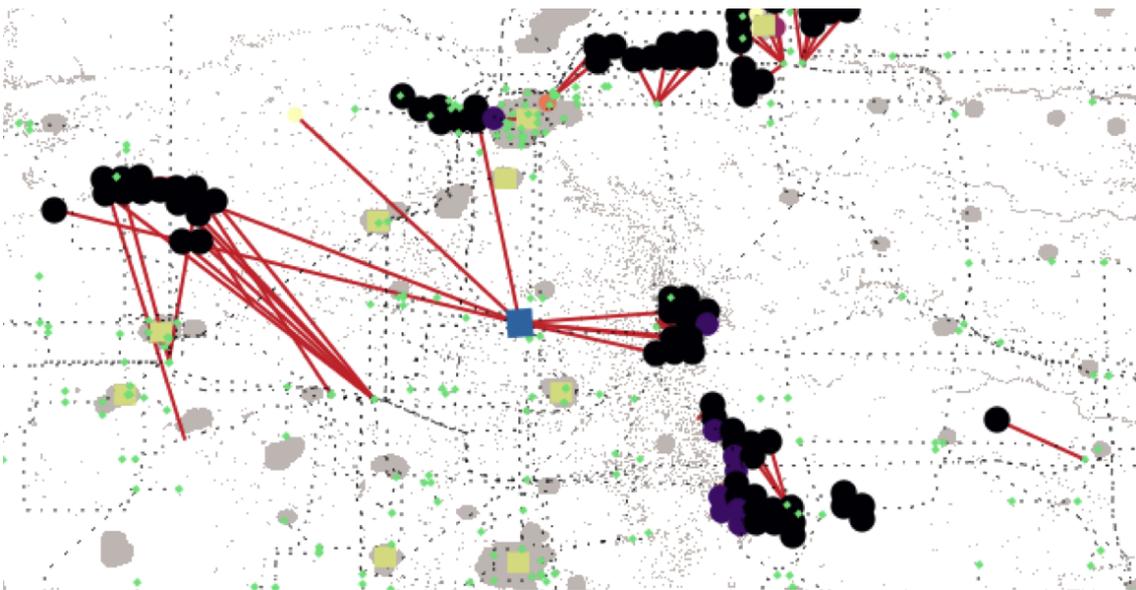

Transmission plays a vital role in assessing the deployment costs of renewable energy deployment

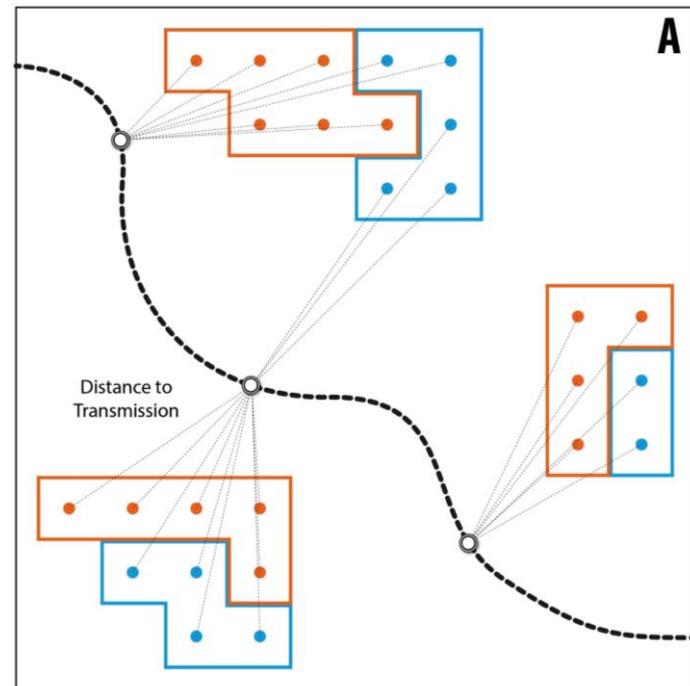

Distribution of plant and transmission costs across space

# Supply Curve: Levelized Cost of Transmission (LCOT)

- Routing is by Euclidean distance
- Assumption of transmission capacity availability (10%)
- Synthetic features used to model high RE penetration scenarios
- Competitive connection method could be improved

reV routes spur lines from potential generator locations to transmission features (Point of Interconnect)

# Integral Part of a Modeling Community

reV is Powerful Analysis and Modeling Software,

Resource Dataset Modeling

*Where and How Much  
Resource is Available?*

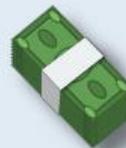

Site Suitability Analysis

*Where Can We Build and  
How Much Power Can We Generate?*

System Modeling

*What Kind of System Do We Build  
to Generate the Power We Need?*

Supply Curve Modeling

*How Does Energy Cost  
Affect Energy Supply?*

and its products enable others to do even more.

Production Cost Modeling

*How Do We Get Power Where It's  
Needed, When It's Needed?*

Renewable Energy Zones

*How Do We Plan Transmission  
Systems to Access High Quality  
Renewable Energy?*

Capacity Expansion Modeling

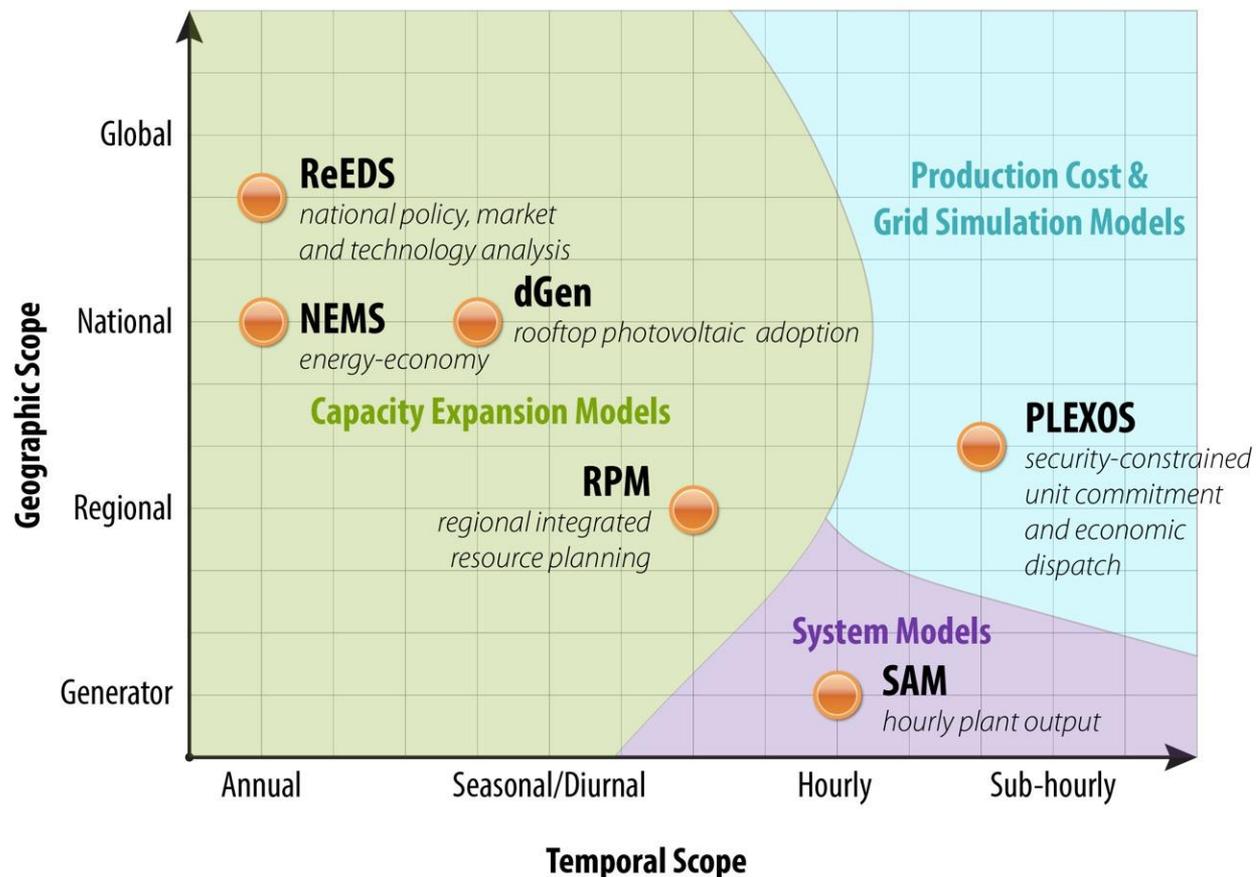

*Where Do We Put New Power Plants?*

Policy Design

*How Do We Design Policy  
to Take Advantage of  
Local Resources?*

# Next Steps: Deployment Potential

**Technical potential** provides an estimate of the upper bounds of available capacity which does not inform where solar or wind deployment is most viable.

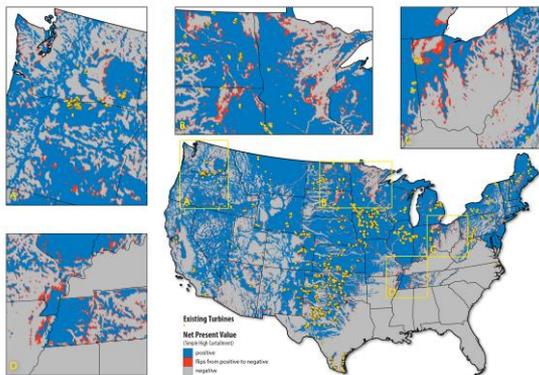

**Deployment potential** aims to represent the principal spatial drivers of solar and wind deployment viability.

- Where are the opportunities and barriers for solar and wind deployment?
- Where is it feasible and practical to deploy, and at what cost?
- Where is technological innovation needed and what role can it play to improve viability?

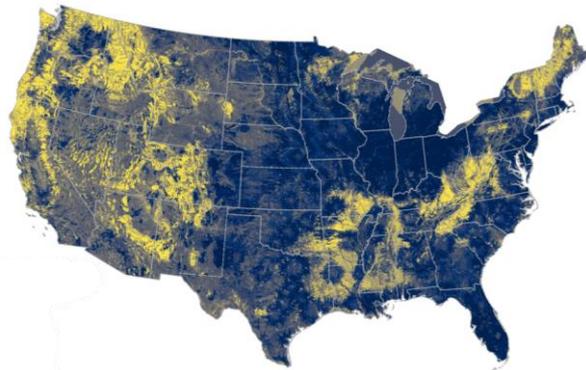

# Next Steps: Deployment Potential

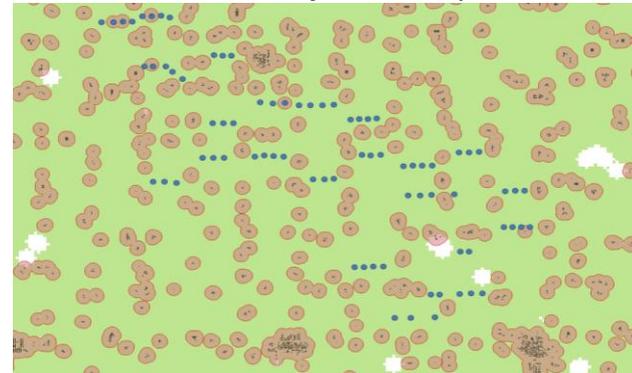

### Spatially Explicit Cost Modeling

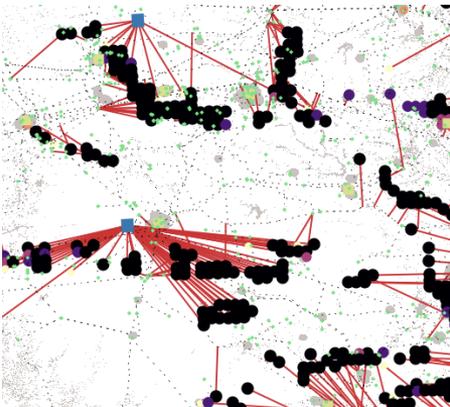

### Variable Power Density

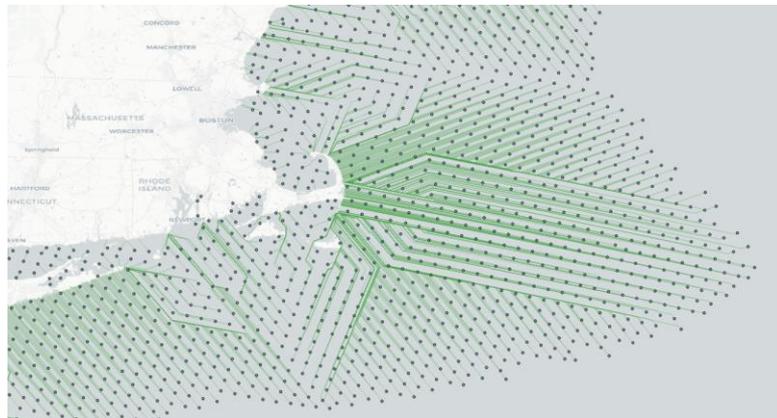

### Wind turbine setbacks from occupied buildings

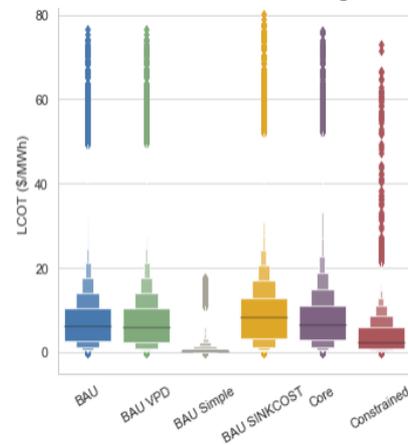

### Transmission Routing

### Offshore Wind Energy Potential

### Scenario Modeling

# Thank You!
