# Developing Models with RIGOUR

Department for Business Energy and Industrial Strategy

March 2020

  
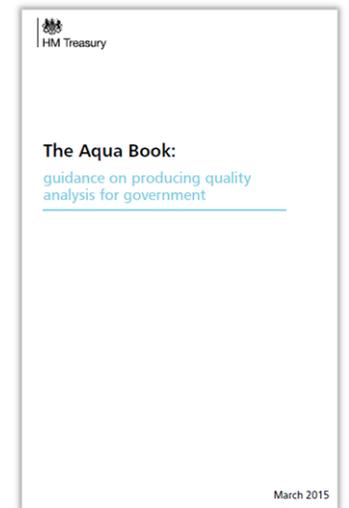

Department for  
Business, Energy  
& Industrial Strategy

# Purpose

- Introduce a scenario based model

## “The Mackay Carbon Calculator”

- Describe our assurance process for models we develop
  - In-house
  - Outsourced

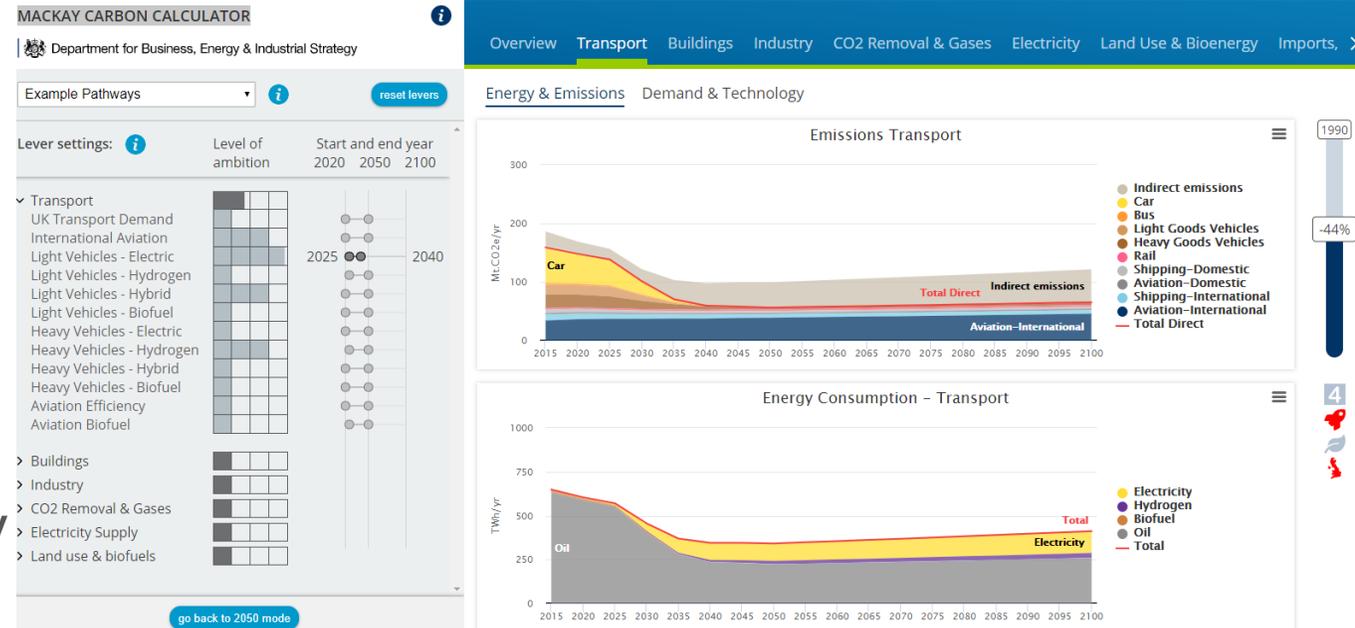

Based on the Analytical Quality Assurance Book – The AQuA Book

RIG  
Department for  
Business, Energy  
& Industrial Strategy

# The model - Mackay Carbon Calculator

- UK developed the first calculator
- Many others developed since then
- The new model introduces
  - Modelling to 2100
  - Ability to change start and end dates
  - Completely updated technology “levers”
    - Fractional values for levers
- Assumptions and data align with
  - Current science and
  - More complex models

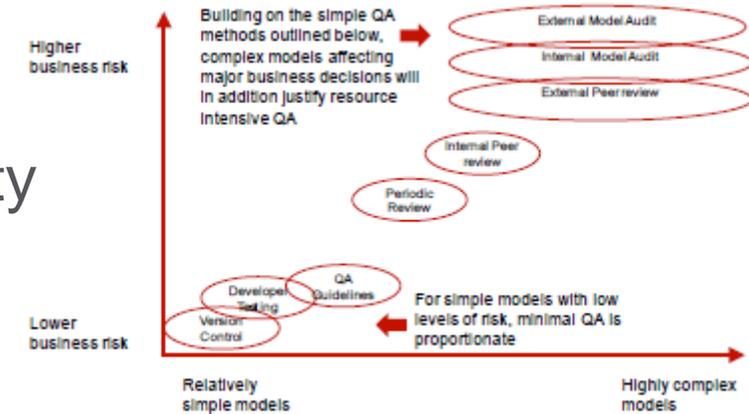

So how do we know it works?

# Principles

1. You can't assure your own model
2. Assurance time depends on importance and complexity
3. Set time for re-reviewing models and assumptions
4. See the process in action not just the results – important for commissioned work
5. RIGOUR – repeatable, independent, grounded in reality, objective, understood uncertainty, results address the question

# Modelling Quality Assurance - Steps

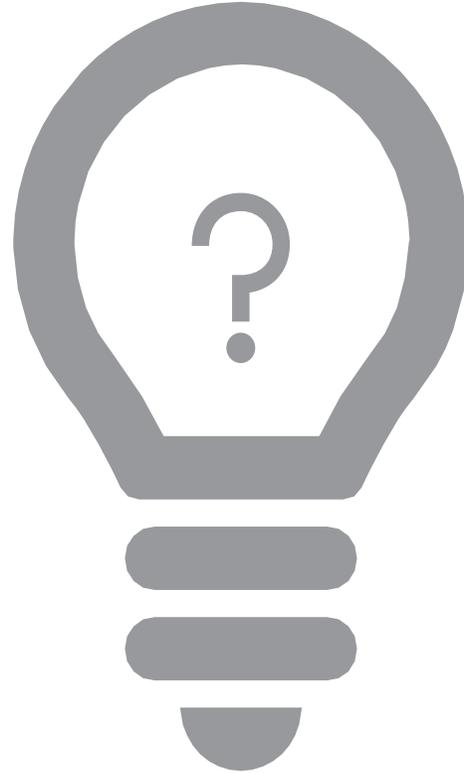

1. Documenting a model: scope, specification, “map”, technical guide, “sign off”
2. Structure & Clarity: depends on language
  - Excel example
3. Validation – is the model doing the right thing
4. Verification – is the model doing it right
5. Assumptions: Using the assumptions log

Documented using a log book

Single location– Rates assurance 0-100, locates documents, provides audit trail
