

## COUNTRY INDICATORS AND SDGS

GDP per capita 8.1.1 Real GDP growth rate

7.3.1 Energy intensity

7.1.1 Access to electricity (% population)  
7.1.2 Access to clean cooking (% population)  
7.2.1 Renewable energy (% TREC)

7.a.1 Public flows to renewables

7.b.1 Per capita renewable capacity

11.6.2 Air particulate matter (PM<sub>2.5</sub>)

## TOTAL ENERGY SUPPLY (TES)

Total Energy Supply (TES)	2014	2019
Non-renewable (TJ)	112 367	70 635
Renewable (TJ)	4 540	4 540
Total (TJ)	116 907	75 175
Renewable share (%)	4	6

Growth in TES	2014-19	2018-19
Non-renewable (%)	-37.1	-25.1
Renewable (%)	0.0	0.0
Total (%)	-35.7	-24.0

Primary energy trade	2014	2019
Imports (TJ)	11 987	12 805
Exports (TJ)	796 007	505 982
Net trade (TJ)	784 020	493 177

Imports (% of supply)	10	17
Exports (% of production)	88	89
Energy self-sufficiency (%)	771	758

Total energy supply in 2019

Renewable energy supply in 2019

## RENEWABLE ENERGY CONSUMPTION (TFEC)

### Renewable TFE trend

### Renewable energy consumption in 2019

Consumption by sector	2014	2019
Industry (TJ)	103	123
Transport (TJ)	0	0
Households (TJ)	3 931	3 930
Other (TJ)	177	133

## ELECTRICITY CAPACITY

### Installed capacity trend

### Renewable capacity in 2021

### Net capacity change (GW)

### Net capacity change in 2021 (MW)

### Capacity utilisation in 2020 (%)

## ELECTRICITY GENERATION

Generation in 2020	GWh	%
<b>Non-renewable</b>	<b>937</b>	<b>88</b>
<b>Renewable</b>	<b>127</b>	<b>12</b>
Hydro and marine	127	12
Solar	0	0
Wind	0	0
Bioenergy	0	0
Geothermal	0	0
<b>Total</b>	<b>1 064</b>	<b>100</b>

## LATEST POLICIES, PROGRAMMES AND LEGISLATION

- 1 Ministerial Order No 04/2013 - Petroleum Operations Regulations 2013
- 2 Hydrocarbons Law No 08/2006 2006

## ENERGY AND EMISSIONS

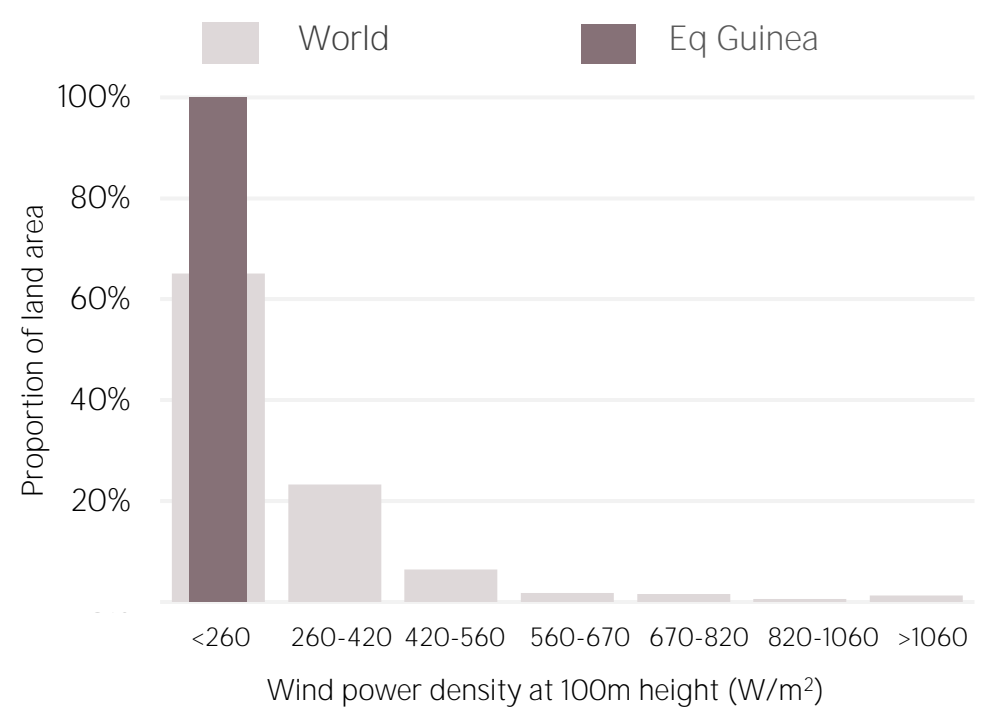

Avoided emissions based on fossil fuel mix used for power

Calculated by dividing power sector emissions by elec. + heat gen.

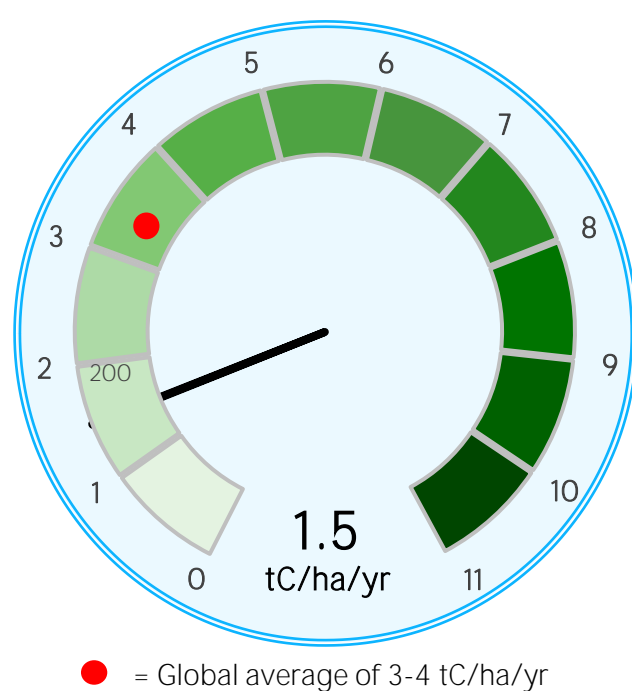

Distribution of solar potential

Distribution of wind potential

Biomass potential: net primary production

Indicators of renewable resource potential

**Solar PV:** Solar resource potential has been divided into seven classes, each representing a range of annual PV output per unit of capacity (kWh/kWp/yr). The bar chart shows the proportion of a country's land area in each of these classes and the global distribution of land area across the classes (for comparison).

**Onshore wind:** Potential wind power density (W/m<sup>2</sup>) is shown in the seven classes used by NREL, measured at a height of 100m. The bar chart shows the distribution of the country's land area in each of these classes compared to the global distribution of wind resources. Areas in the third class or above are considered to be a good wind resource.

**Biomass:** Net primary production (NPP) is the amount of carbon fixed by plants and accumulated as biomass each year. It is a basic measure of biomass productivity. The chart shows the average NPP in the country (tC/ha/yr), compared to the global average NPP of 3-4 tonnes of carbon

**Sources:** IRENA statistics, plus data from the following sources: UN SDG Database (original sources: WHO; World Bank; IEA; IRENA; and UNSD); UN World Population Prospects; UNSD Energy Balances; UN COMTRADE; World Bank World Development Indicators; EDGAR; REN21 Global Status Report; IEA-IRENA Joint Policies and Measures Database; IRENA Global Atlas; and World Bank Global Solar Atlas and Global Wind Atlas.

**Additional notes:** Capacity per capita and public investments SDGs only apply to developing areas. Energy self-sufficiency has been defined as total primary energy production divided by total primary energy supply. Energy trade includes all commodities in Chapter 27 of the Harmonised System (HS). Capacity utilisation is calculated as annual generation divided by year-end capacity x 8,760h/year. Avoided emissions from renewable power is calculated as renewable generation divided by fossil fuel generation multiplied by reported emissions from the power sector. This assumes that, if renewable power did not exist, fossil fuels would be used in its place to generate the same amount of power and using the same mix of fossil fuels. In countries and years where no fossil fuel generation occurs, an average fossil fuel emission factor has been used to calculate the avoided emissions.

These profiles have been produced to provide an overview of developments in renewable energy in different countries and areas. The IRENA statistics team would welcome comments and feedback on its structure and content, which can be sent to [statistics@irena.org](mailto:statistics@irena.org).
