

## COUNTRY INDICATORS AND SDGs

GDP per capita — 8.1.1 Real GDP growth rate

7.3.1 Energy intensity

 7.1.1 Access to electricity (% population)  
 7.1.2 Access to clean cooking (% population)  
 7.2.1 Renewable energy (% TREC)

7.a.1 Public flows to renewables

7.b.1 Per capita renewable capacity

11.6.2 Air particulate matter (PM<sub>2.5</sub>)

## TOTAL ENERGY SUPPLY (TES)

Total Energy Supply (TES)	2016	2021
Non-renewable (TJ)	14 114	21 161
Renewable (TJ)	84 999	87 077
Total (TJ)	99 113	108 238
Renewable share (%)	86	80

Growth in TES	2016-21	2020-21
Non-renewable (%)	+49.9	+17.6
Renewable (%)	+2.4	-0.2
Total (%)	+9.2	+2.9

Total energy supply in 2021

Renewable energy supply in 2021

Primary energy trade	2016	2021
Imports (TJ)	13 980	20 423
Exports (TJ)	14	32
Net trade (TJ)	- 13 966	- 20 391
Imports (% of supply)	14	19
Exports (% of production)	0	0
Energy self-sufficiency (%)	87	82

## RENEWABLE ENERGY CONSUMPTION (TFEC)

### Renewable TFEC trend

Consumption by sector	2016	2021
Industry (TJ)	6 030	6 529
Transport (TJ)	0	0
Households (TJ)	62 773	63 578
Other (TJ)	17 121	18 957

### Renewable energy consumption in 2021

## ELECTRICITY CAPACITY

### Installed capacity trend

### Renewable capacity in 2023

### Net capacity change (GW)

### Net capacity change in 2023 (MW)

### Capacity utilisation in 2022 (%)

## ELECTRICITY GENERATION

Generation in 2022	GWh	%
Non-renewable	494	47
Renewable	554	53
Hydro and marine	516	49
Solar	36	3
Wind	0	0
Bioenergy	2	0
Geothermal	0	0
<b>Total</b>	<b>1 048</b>	<b>100</b>

Per capita electricity generation (kWh)

Electricity generation trend

## LATEST POLICIES, PROGRAMMES AND LEGISLATION

- 1 MEPS for Air Conditioners 2021
- 2 MEPS for Refrigerators 2021
- 3 Minimum Standards for Solar Home Systems 2019
- 4 National Cooling Strategy 2019
- 5 National Environment and Climate Change Policy 2019

## ENERGY AND EMISSIONS

CO<sub>2</sub> emissions by sector

Avoided emissions from renewable elec. & heat

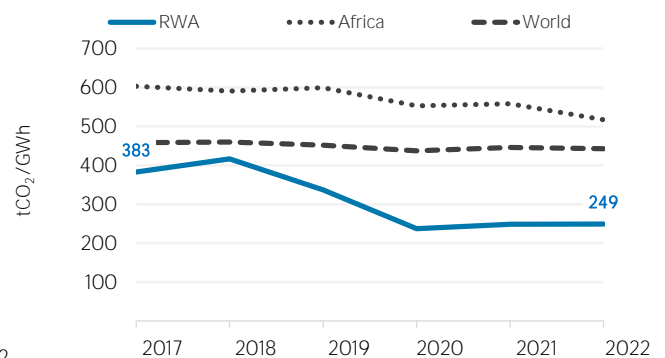

Avoided emissions based on fossil fuel mix used for power

Elec. & heat generation CO<sub>2</sub> emissions in

CO<sub>2</sub> emission factor for elec. & heat generation

Calculated by dividing power sector emissions by elec. + heat gen.

## RENEWABLE RESOURCE POTENTIAL

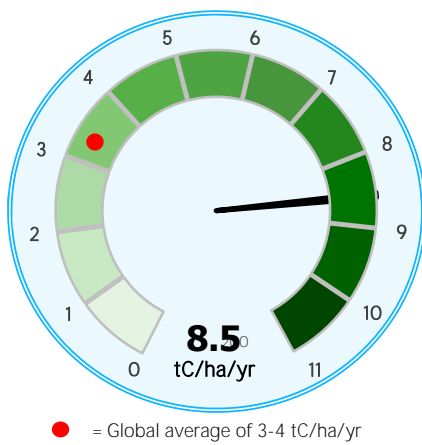

### Distribution of solar potential

### Distribution of wind potential

### Biomass potential: net primary production

### Indicators of renewable resource potential

**Solar PV:** Solar resource potential has been divided into seven classes, each representing a range of annual PV output per unit of capacity (kWh/kWp/yr). The bar chart shows the proportion of a country's land area in each of these classes and the global distribution of land area across the classes (for comparison).

**Onshore wind:** Potential wind power density ( $W/m^2$ ) is shown in the seven classes used by NREL, measured at a height of 100m. The bar chart shows the distribution of the country's land area in each of these classes compared to the global distribution of wind resources. Areas in the third class or above are considered to be a good wind resource.

**Biomass:** Net primary production (NPP) is the amount of carbon fixed by plants and accumulated as biomass each year. It is a basic measure of biomass productivity. The chart shows the average NPP in the country (tC/ha/yr), compared to the global average NPP of 3-4 tonnes of carbon

**Sources:** IRENA statistics, plus data from the following sources: UN SDG Database (original sources: WHO: World Bank: IEA: IRENA: and UNSD); UN World Population Prospects; UNSD Energy Balances; UN COMTRADE; World Bank World Development Indicators; EDGAR; REN21 Global Status Report; IEA-IRENA Joint Policies and Measures Database; IRENA Global Atlas; and World Bank Global Solar Atlas and Global Wind Atlas.

**Additional notes:** Capacity per capita and public investments SDGs only apply to developing areas. Energy self-sufficiency has been defined as total primary energy production divided by total primary energy supply. Energy trade includes all commodities in Chapter 27 of the Harmonised System (HS). Capacity utilisation is calculated as annual generation divided by year-end capacity x 8,760h/year. Avoided emissions from renewable power is calculated as renewable generation divided by fossil fuel generation multiplied by reported emissions from the power sector. This assumes that, if renewable power did not exist, fossil fuels would be used in its place to generate the same amount of power and using the same mix of fossil fuels. In countries and years where no fossil fuel generation occurs, an average fossil fuel emission factor has been used to calculate the avoided emissions.

These profiles have been produced to provide an overview of developments in renewable energy in different countries and areas. The IRENA statistics team would welcome comments and feedback on its structure and content, which can be sent to [statistics@irena.org](mailto:statistics@irena.org).
