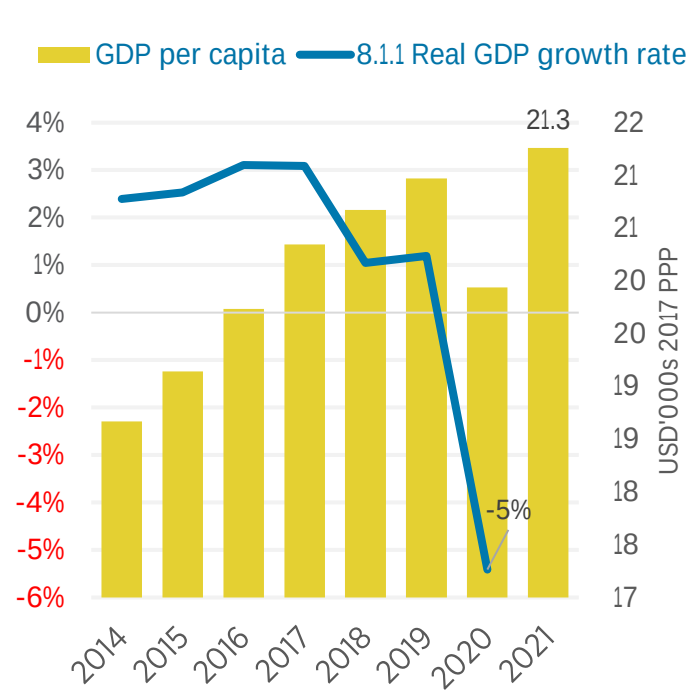
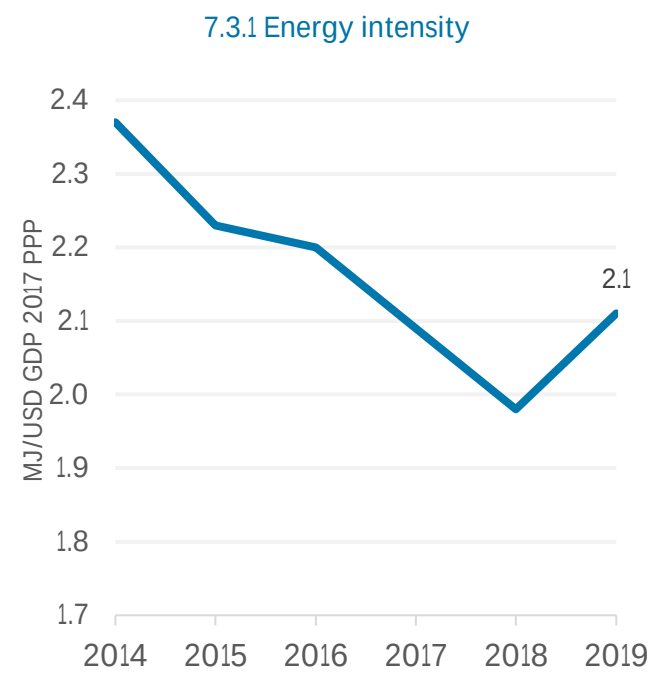
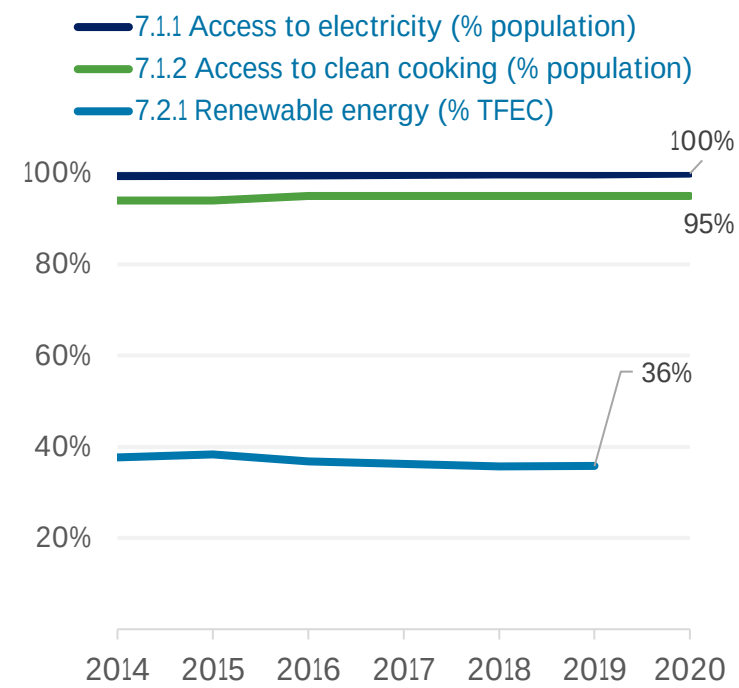
ENERGY PROFILE

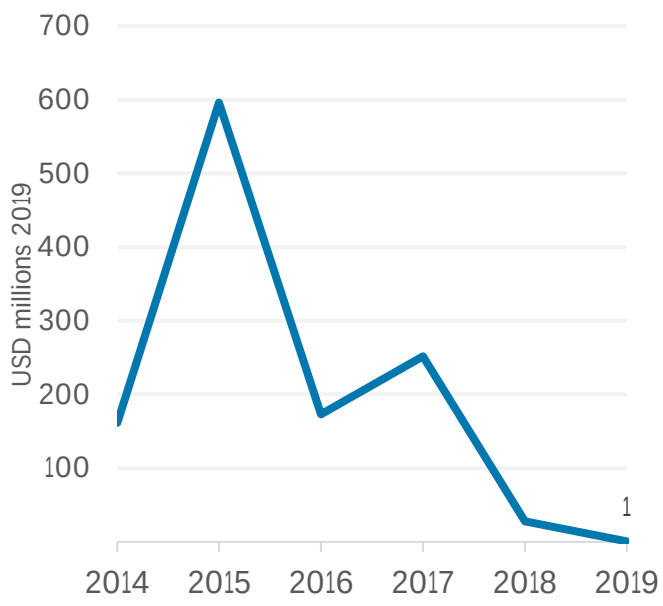
Costa Rica

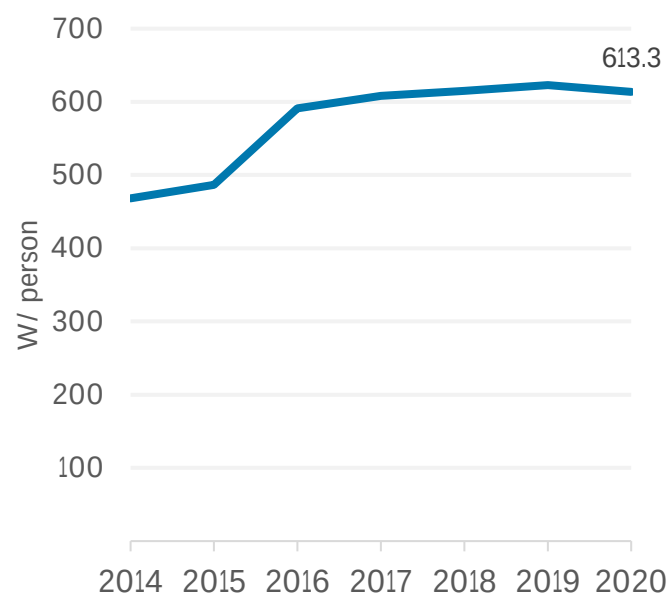
COUNTRY INDICATORS AND SDGS

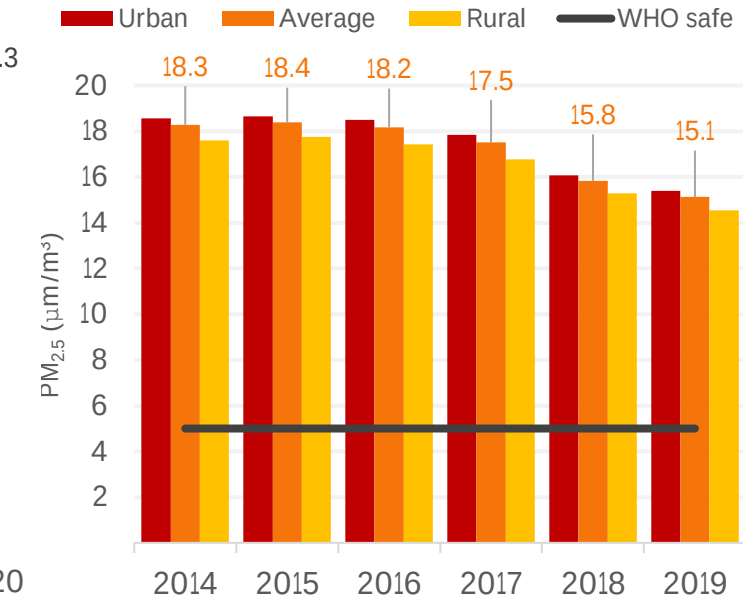












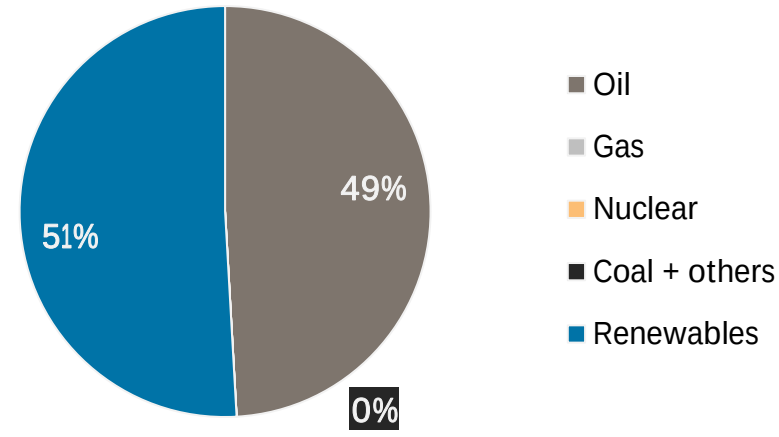
TOTAL ENERGY SUPPLY (TES)

Total Energy Supply (TES)	2014	2019
Non-renewable (TJ)	102 587	108 419
Renewable (TJ)	110 859	112 360
Total (TJ)	213 446	220 779
Renewable share (%)	52	51

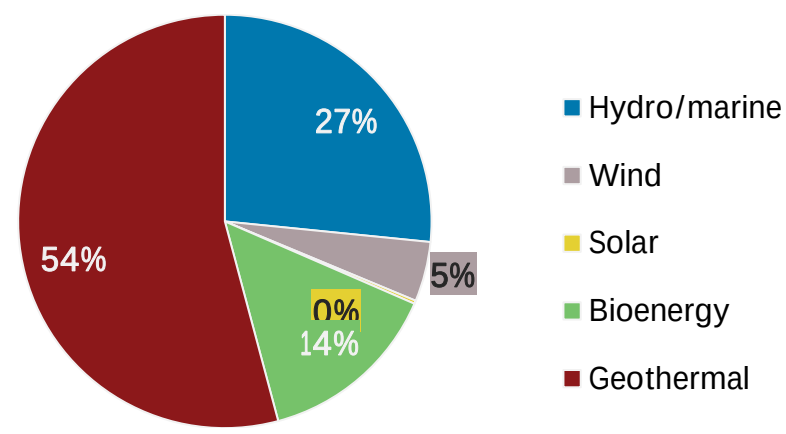
Growth in TES	2014-19	2018-19
Non-renewable (%)	+5.7	-1.6
Renewable (%)	+1.4	+6.9
Total (%)	+3.4	+2.5

Primary energy trade	2014	2019
Imports (TJ)	113 430	123 330
Exports (TJ)	2 826	3 237
Net trade (TJ)	- 110 604	- 120 093
Imports (% of supply)	53	56
Exports (% of production)	3	3
Energy self-sufficiency (%)	52	51

Total energy supply in 2019

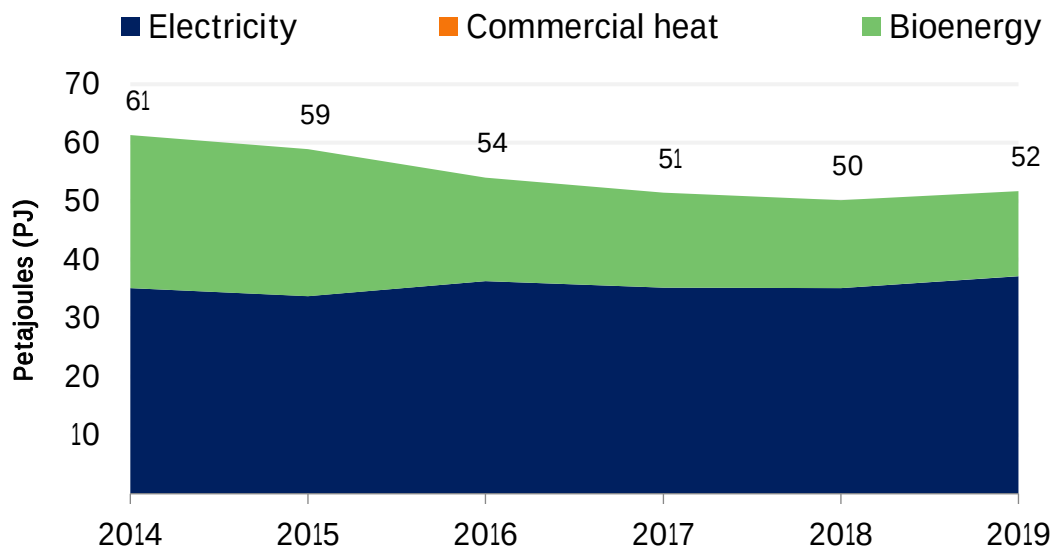


Renewable energy supply in 2019



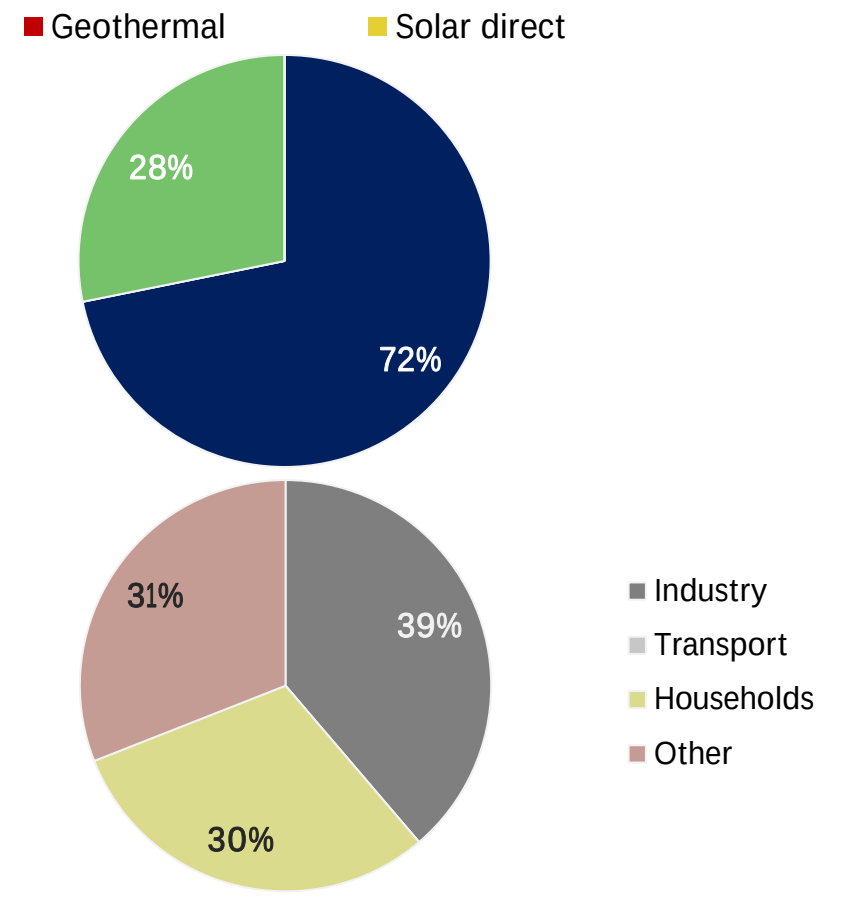
RENEWABLE ENERGY CONSUMPTION (TFEC)

Renewable TFEC trend



Consumption by sector	2014	2019
Industry (TJ)	26 736	20 057
Transport (TJ)	0	0
Households (TJ)	18 906	15 678
Other (TJ)	15 678	16 026

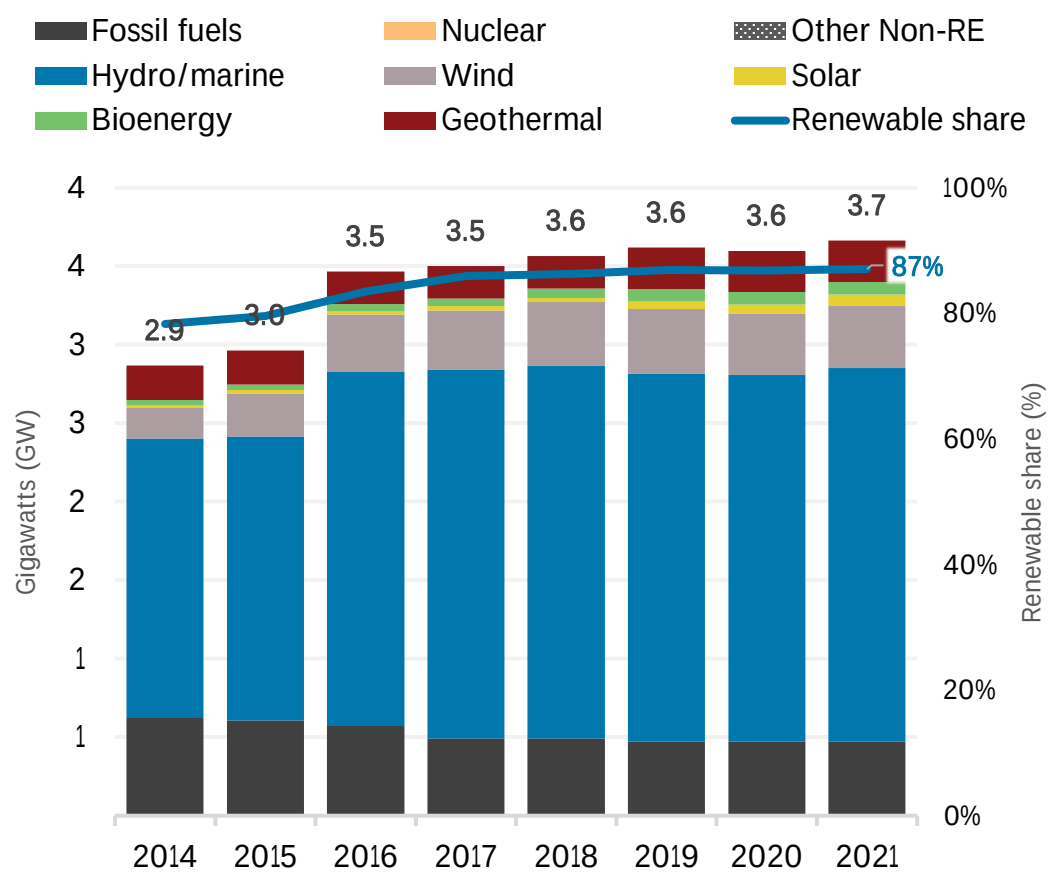
Renewable energy consumption in 2019



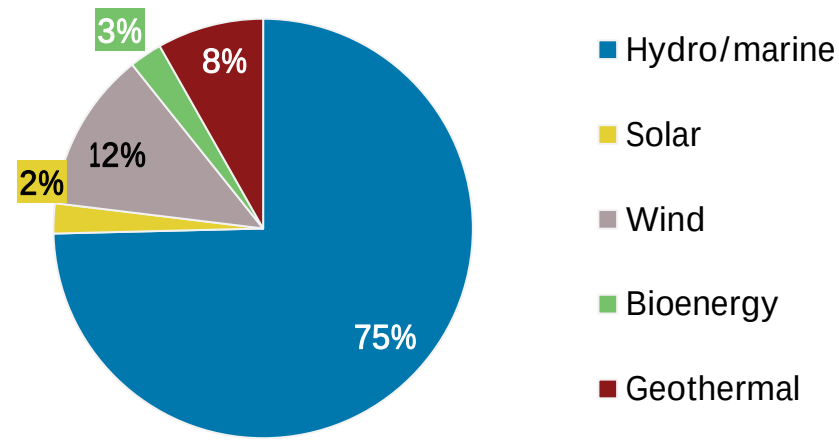
n.a.

ELECTRICITY CAPACITY

Installed capacity trend



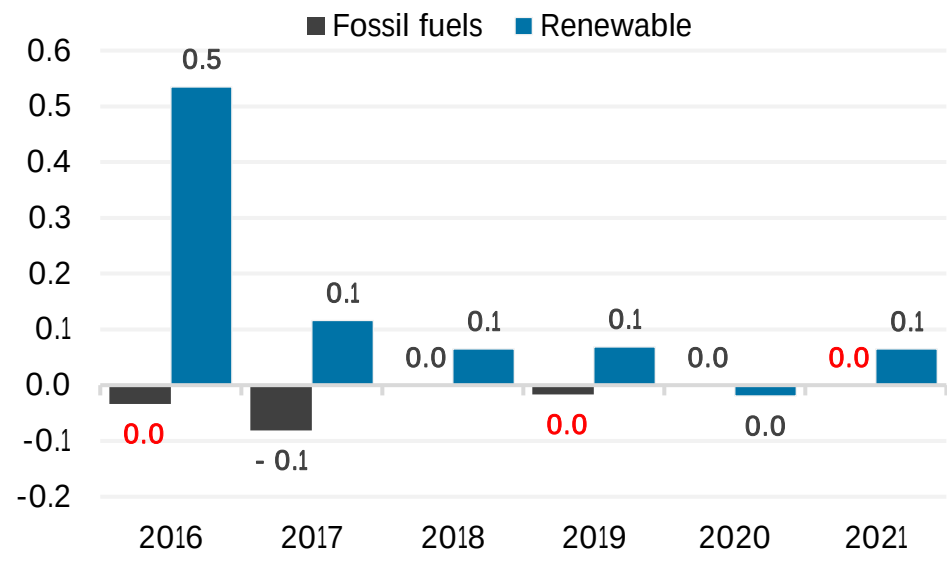
Renewable capacity in 2021



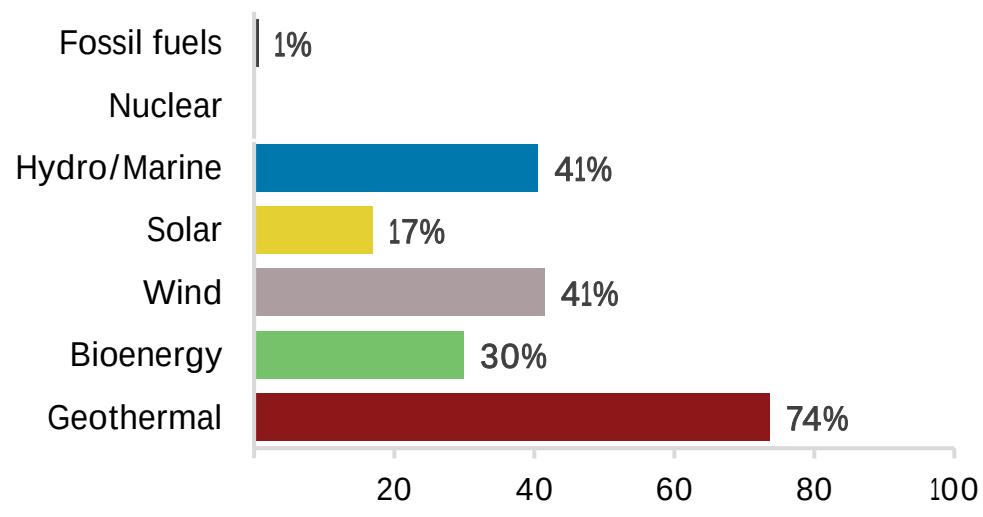
Net capacity change in 2021 (MW)

Non-renewable	+ 0
Hydro and marine	+ 48
Solar	+ 17
Wind	0
Bioenergy	0
Geothermal	0

Net capacity change (GW)



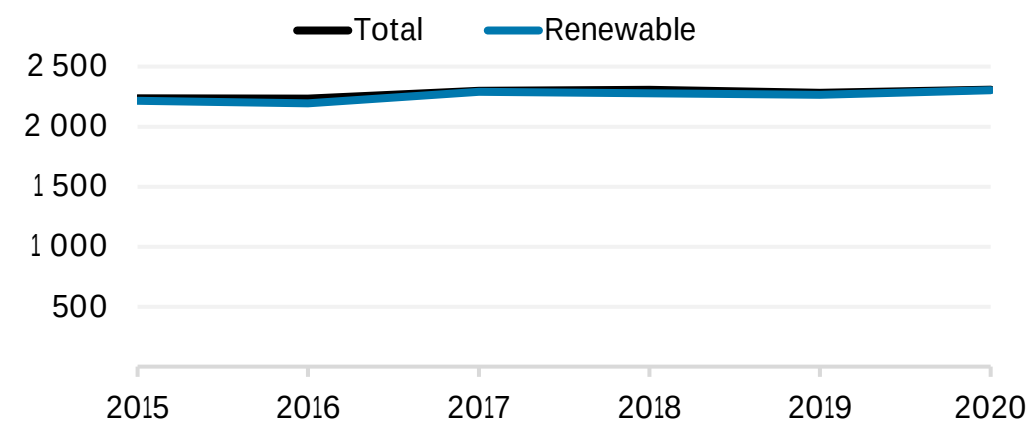
Capacity utilisation in 2020 (%)



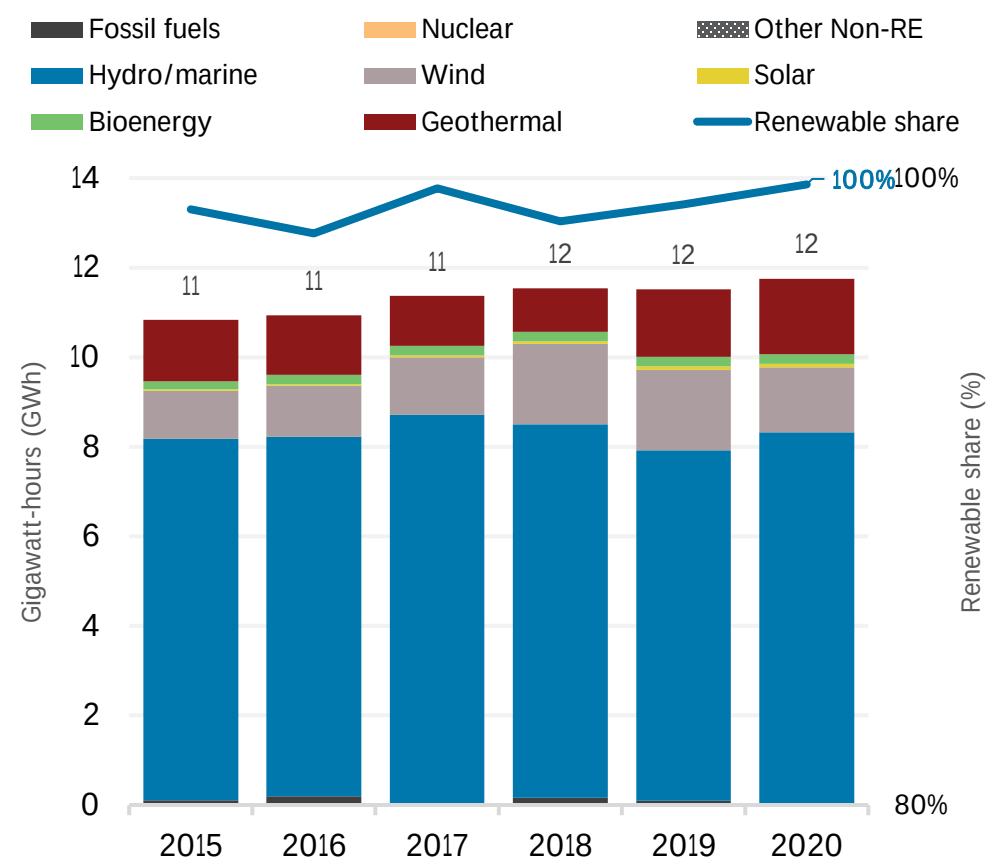
ELECTRICITY GENERATION

Generation in 2020	GWh	%
Non-renewable	**24**	**0**
Renewable	**11 731**	**100**
Hydro and marine	8 294	71
Solar	78	1
Wind	1 459	12
Bioenergy	210	2
Geothermal	1 689	14
Total	**11 755**	**100**

Per capita electricity generation (kWh)



Electricity generation trend

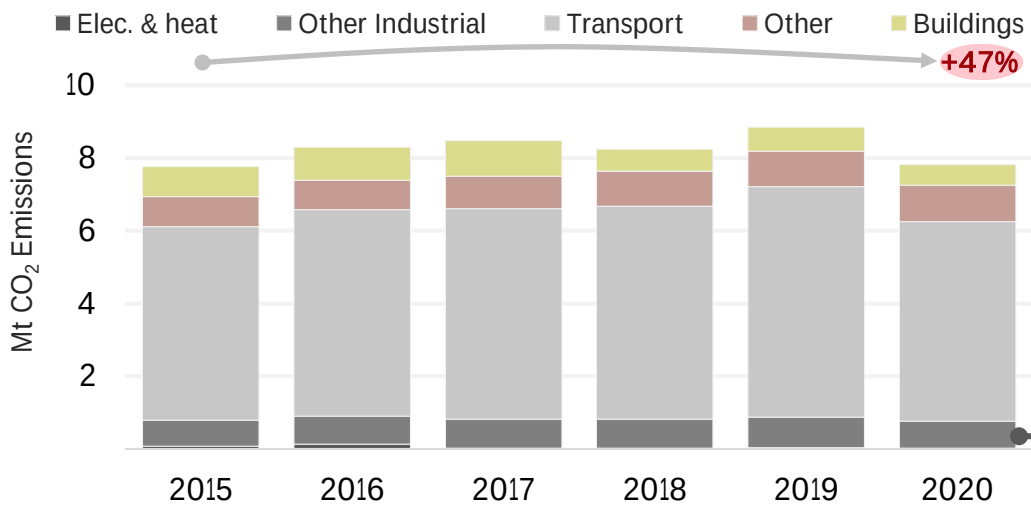


LATEST POLICIES, PROGRAMMES AND LEGISLATION

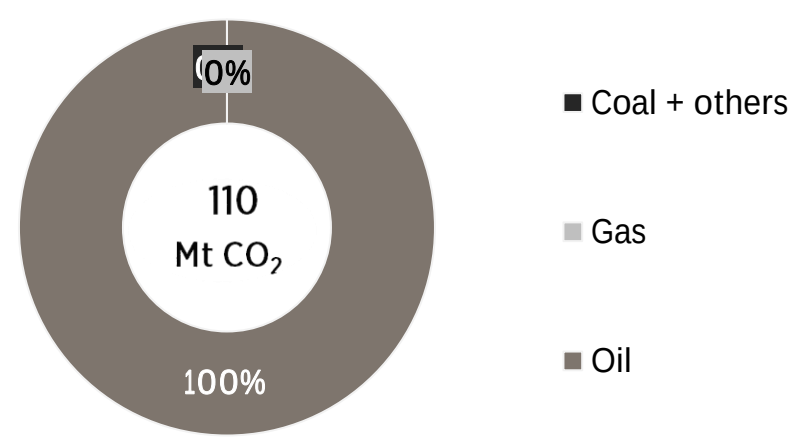
1	Exemption excise tax	2018
2	Exemption general sales tax	2018
3	Law 9518 - Incentives and promotion for electric transport	2018
4	Costa Rica Electricity Generation Expansion Plan 2016-2035 (Plan de Expansion de la Generacion Electrica) 2017	2017
5	Costa Rica Regulation of liquid biofuels and their mixtures 2017	2017

ENERGY AND EMISSIONS

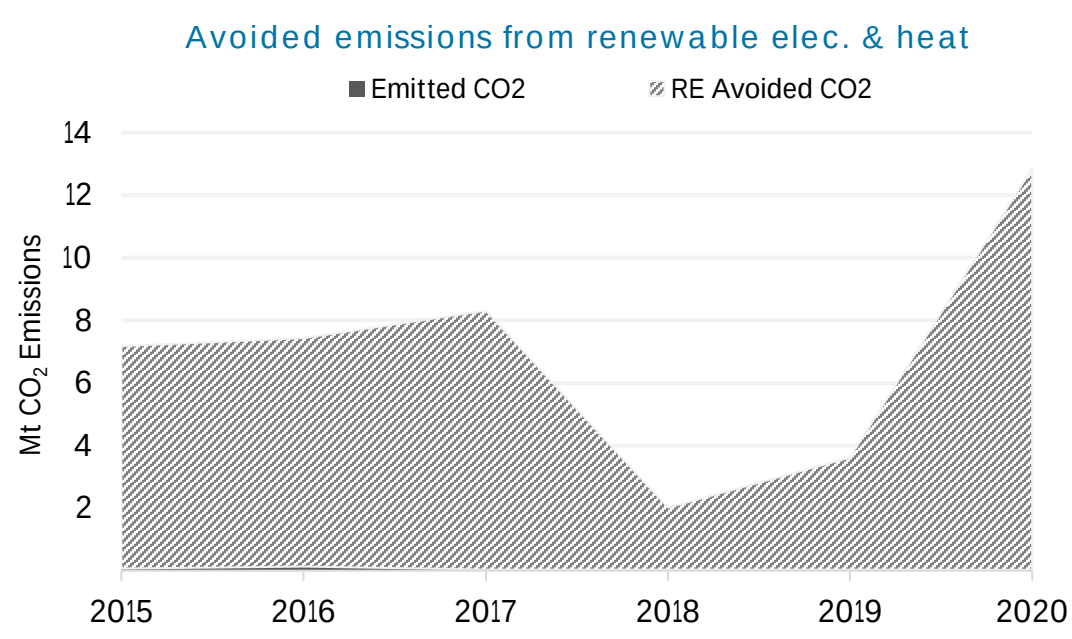
Energy-related CO_2 emissions by sector



Elec. & heat generation CO_2 emissions in

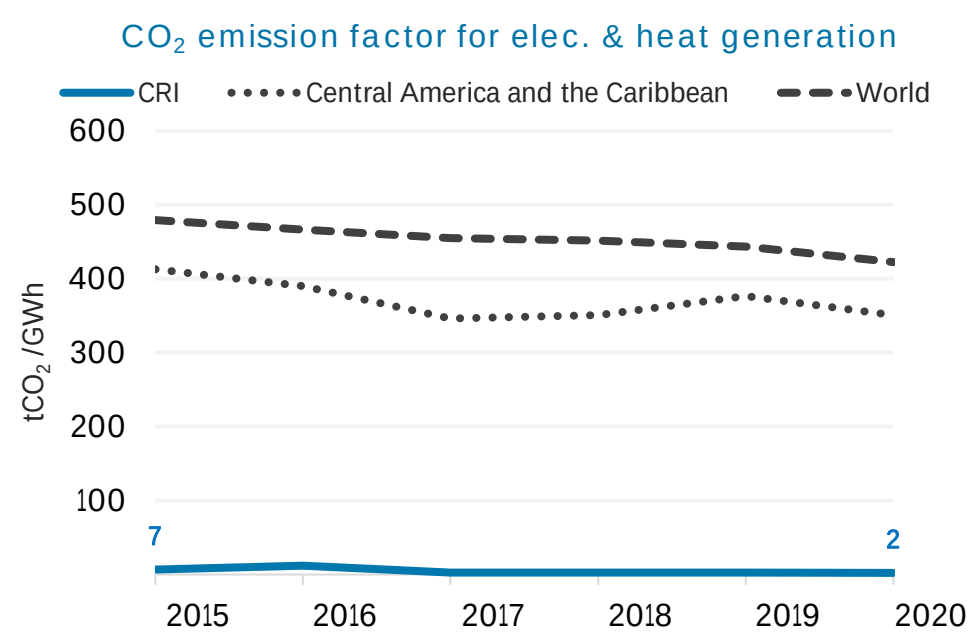


Avoided emissions from renewable elec. & heat



Avoided emissions based on fossil fuel mix used for power

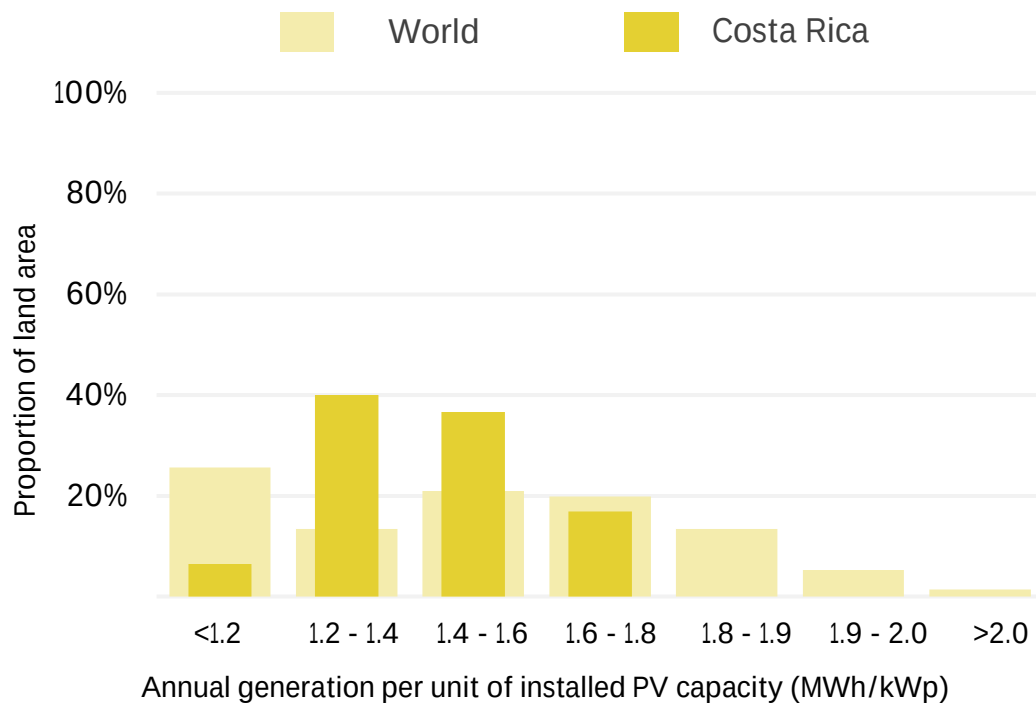
CO_2 emission factor for elec. & heat generation



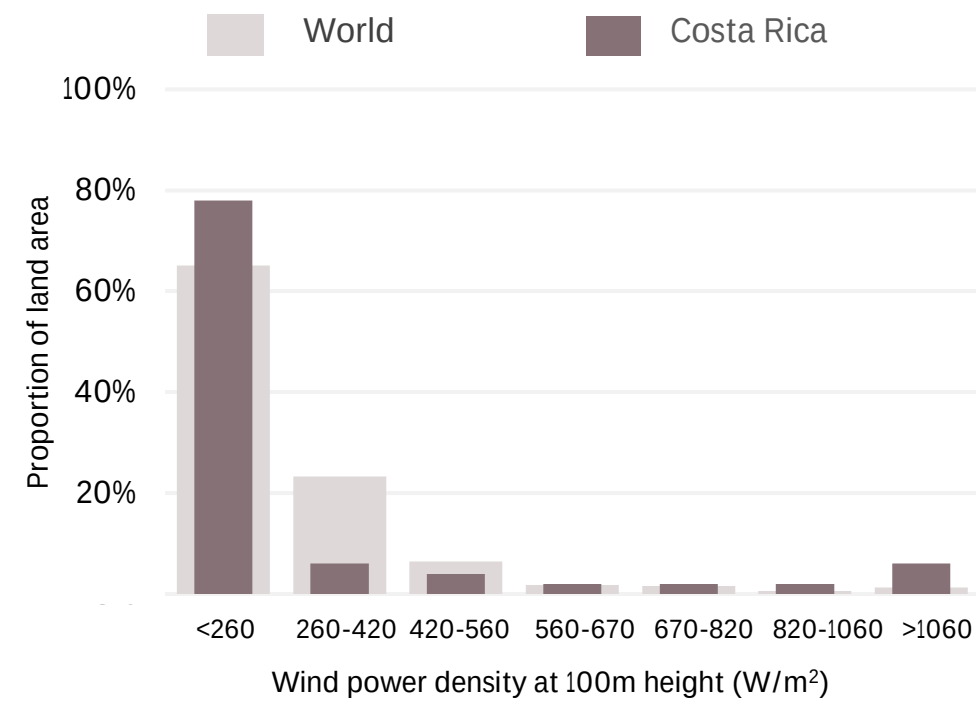
Calculated by dividing power sector emissions by elec. + heat gen.

RENEWABLE RESOURCE POTENTIAL

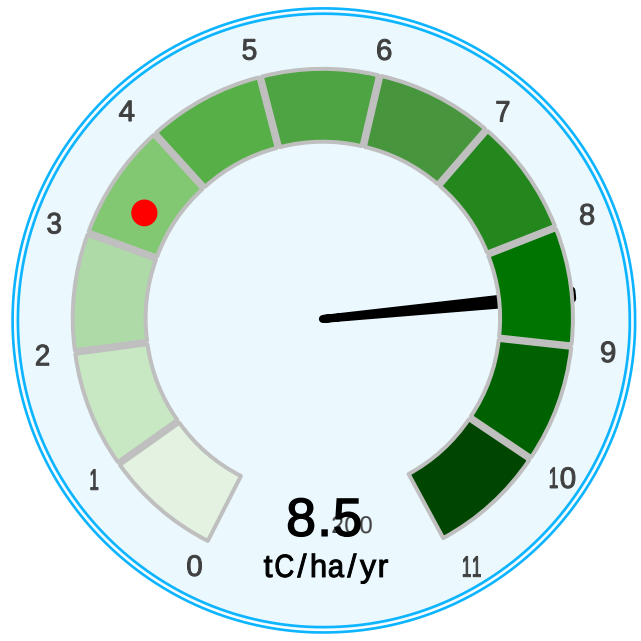
Distribution of solar potential



Distribution of wind potential



Biomass potential: net primary production



= Global average of 3-4 tC/ha/yr

Indicators of renewable resource potential

Solar PV: Solar resource potential has been divided into seven classes, each representing a range of annual PV output per unit of capacity (kWh/kWp/yr). The bar chart shows the proportion of a country's land area in each of these classes and the global distribution of land area across the classes (for comparison).

Onshore wind: Potential wind power density (W/m^2) is shown in the seven classes used by NREL, measured at a height of 100m. The bar chart shows the distribution of the country's land area in each of these classes compared to the global distribution of wind resources. Areas in the third class or above are considered to be a good wind resource.

Biomass: Net primary production (NPP) is the amount of carbon fixed by plants and accumulated as biomass each year. It is a basic measure of biomass productivity. The chart shows the average NPP in the country (tC/ha/yr), compared to the global average NPP of 3-4 tonnes of carbon

Sources: IRENA statistics, plus data from the following sources: UN SDG Database (original sources: WHO; World Bank; IEA; IRENA; and UNSD); UN World Population Prospects; UNSD Energy Balances; UN COMTRADE; World Bank World Development Indicators; EDGAR; REN21 Global Status Report; IEA-IRENA Joint Policies and Measures Database; IRENA Global Atlas; and World Bank Global Solar Atlas and Global Wind Atlas.

Additional notes: Capacity per capita and public investments SDGs only apply to developing areas. Energy self-sufficiency has been defined as total primary energy production divided by total primary energy supply. Energy trade includes all commodities in Chapter 27 of the Harmonised System (HS). Capacity utilisation is calculated as annual generation divided by year-end capacity x 8,760h/year. Avoided emissions from renewable power is calculated as renewable generation divided by fossil fuel generation multiplied by reported emissions from the power sector. This assumes that, if renewable power did not exist, fossil fuels would be used in its place to generate the same amount of power and using the same mix of fossil fuels. In countries and years where no fossil fuel generation occurs, an average fossil fuel emission factor has been used to calculate the avoided emissions.

These profiles have been produced to provide an overview of developments in renewable energy in different countries and areas. The IRENA statistics team would welcome comments and feedback on its structure and content, which can be sent to statistics@irena.org.
