

## COUNTRY INDICATORS AND SDGS

## TOTAL ENERGY SUPPLY (TES)

Total Energy Supply (TES)	2014	2019
Non-renewable (TJ)	136 430	167 657
Renewable (TJ)	50 710	44 218
Total (TJ)	187 141	211 874
Renewable share (%)	27	21

Growth in TES	2014-19	2018-19
Non-renewable (%)	+22.9	+9.4
Renewable (%)	-12.8	-5.2
Total (%)	+13.2	+6.0

Primary energy trade	2014	2019
Imports (TJ)	138 394	176 359
Exports (TJ)	5 124	2 373
Net trade (TJ)	- 133 270	- 173 986

Imports (% of supply)	74	83
Exports (% of production)	9	6
Energy self-sufficiency (%)	31	20

### Total energy supply in 2019

### Renewable energy supply in 2019

## RENEWABLE ENERGY CONSUMPTION (TFEC)

Renewable TFEC trend

Renewable energy consumption in 2019

Consumption by sector	2014	2019
Industry (TJ)	8 284	8 291
Transport (TJ)	784	1 072
Households (TJ)	26 581	16 604
Other (TJ)	13 179	15 688

## ELECTRICITY CAPACITY

Installed capacity trend

Renewable capacity in 2021

Net capacity change in 2021 (MW)

Net capacity change (GW)

Capacity utilisation in 2020 (%)

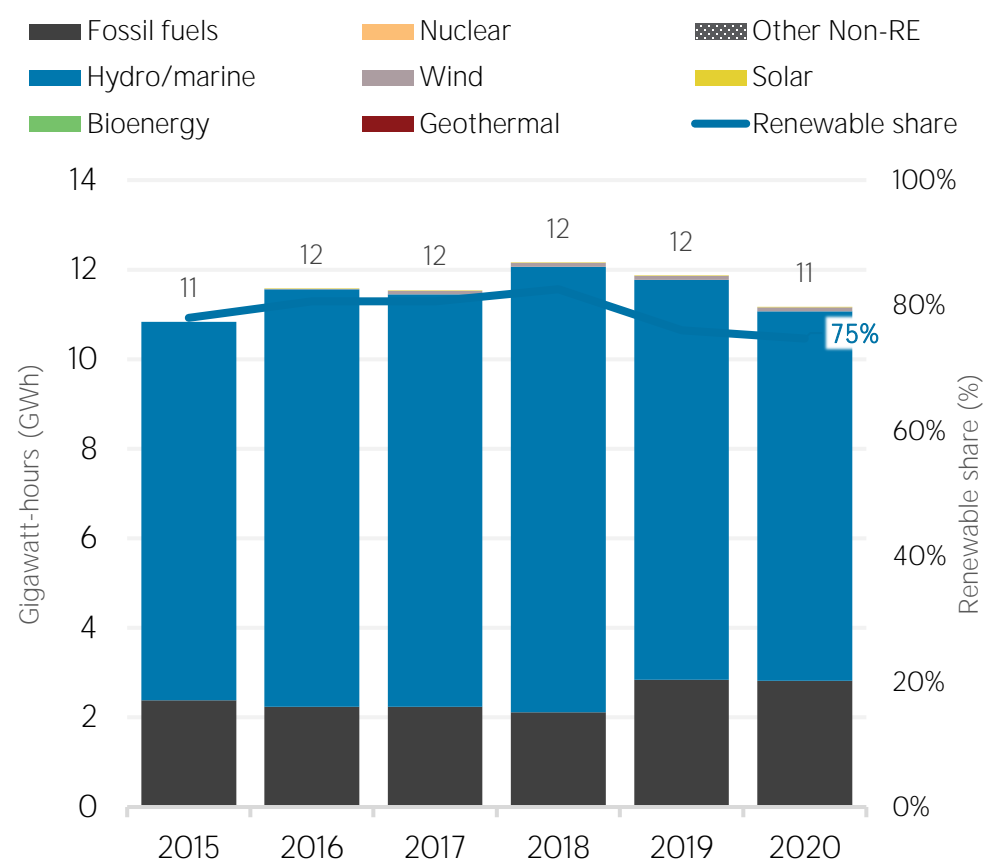

## ELECTRICITY GENERATION

Generation in 2020	GWh	%
<b>Non-renewable</b>	<b>2 821</b>	<b>25</b>
<b>Renewable</b>	<b>8 340</b>	<b>75</b>
Hydro and marine	8 248	74
Solar	1	0
Wind	91	1
Bioenergy	0	0
Geothermal	0	0
<b>Total</b>	<b>11 161</b>	<b>100</b>

## Electricity generation trend

## LATEST POLICIES, PROGRAMMES AND LEGISLATION

- 1 Climate Change Strategy 2030 and Action Plan for 2021-2023 2021
- 2 Law of Georgia on Energy Efficiency of Buildings, Directive #2010/31/EU on Energy Performance of Buildings (EPBD) 2020
- 3 Rule for Accounting the Energy Received from Thermal Pumps 2020
- 4 Rule for Normalization of Accounting Electricity generated from Hydro Energy and Wind Energy 2020
- 5 Support Scheme for Renewable (Hydropower) Generation - Resolution 403 2020

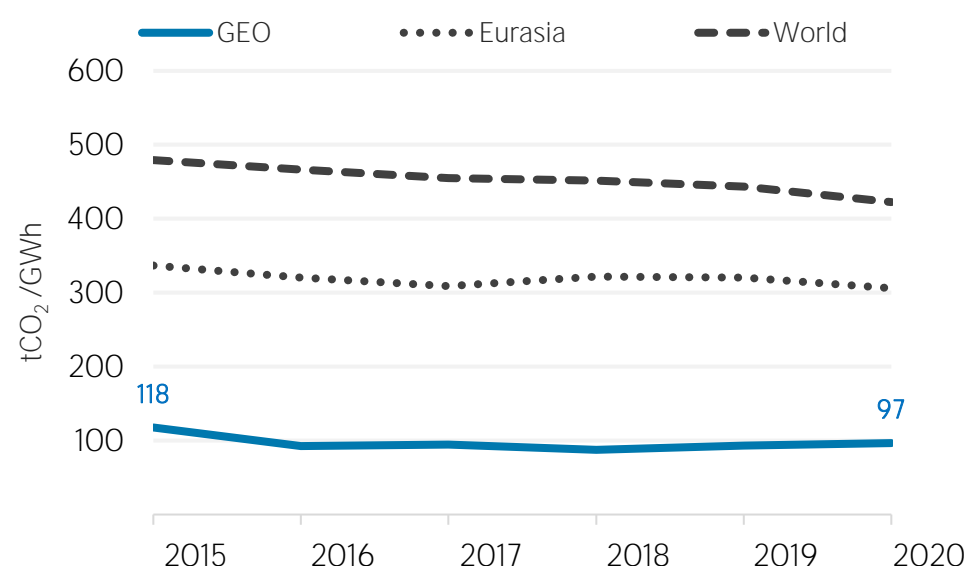

## ENERGY AND EMISSIONS

## Elec. & heat generation CO<sub>2</sub> emissions in

## CO<sub>2</sub> emission factor for elec. & heat generation

Avoided emissions based on fossil fuel mix used for power

Calculated by dividing power sector emissions by elec. + heat gen.

Distribution of solar potential

Distribution of wind potential

Biomass potential: net primary production

● = Global average of 3-4 tC/ha/yr

Indicators of renewable resource potential

**Solar PV:** Solar resource potential has been divided into seven classes, each representing a range of annual PV output per unit of capacity (kWh/kWp/yr). The bar chart shows the proportion of a country's land area in each of these classes and the global distribution of land area across the classes (for comparison).

**Onshore wind:** Potential wind power density (W/m<sup>2</sup>) is shown in the seven classes used by NREL, measured at a height of 100m. The bar chart shows the distribution of the country's land area in each of these classes compared to the global distribution of wind resources. Areas in the third class or above are considered to be a good wind resource.

**Biomass:** Net primary production (NPP) is the amount of carbon fixed by plants and accumulated as biomass each year. It is a basic measure of biomass productivity. The chart shows the average NPP in the country (tC/ha/yr), compared to the global average NPP of 3-4 tonnes of carbon

**Sources:** IRENA statistics, plus data from the following sources: UN SDG Database (original sources: WHO; World Bank; IEA; IRENA; and UNSD); UN World Population Prospects; UNSD Energy Balances; UN COMTRADE; World Bank World Development Indicators; EDGAR; REN21 Global Status Report; IEA-IRENA Joint Policies and Measures Database; IRENA Global Atlas; and World Bank Global Solar Atlas and Global Wind Atlas.

**Additional notes:** Capacity per capita and public investments SDGs only apply to developing areas. Energy self-sufficiency has been defined as total primary energy production divided by total primary energy supply. Energy trade includes all commodities in Chapter 27 of the Harmonised System (HS). Capacity utilisation is calculated as annual generation divided by year-end capacity x 8,760h/year. Avoided emissions from renewable power is calculated as renewable generation divided by fossil fuel generation multiplied by reported emissions from the power sector. This assumes that, if renewable power did not exist, fossil fuels would be used in its place to generate the same amount of power and using the same mix of fossil fuels. In countries and years where no fossil fuel generation occurs, an average fossil fuel emission factor has been used to calculate the avoided emissions.

These profiles have been produced to provide an overview of developments in renewable energy in different countries and areas. The IRENA statistics team would welcome comments and feedback on its structure and content, which can be sent to [statistics@irena.org](mailto:statistics@irena.org).
