

COUNTRY INDICATORS AND SDGS

■ GDP per capita — 8.1.1 Real GDP growth rate

7.3.1 Energy intensity

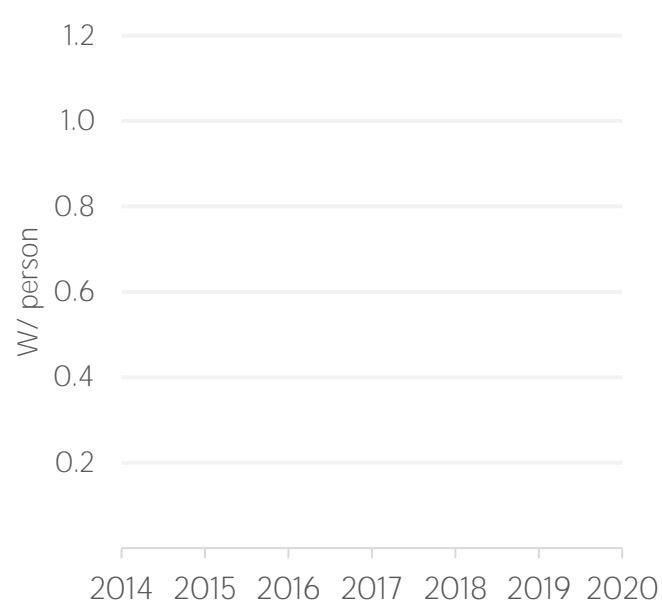

— 7.1.1 Access to electricity (% population)
— 7.1.2 Access to clean cooking (% population)
— 7.2.1 Renewable energy (% TREC)

7.a.1 Public flows to renewables

7.b.1 Per capita renewable capacity

11.6.2 Air particulate matter (PM_{2.5})

TOTAL ENERGY SUPPLY (TES)

Total Energy Supply (TES)	2014	2019
Non-renewable (TJ)	6 991 592	6 235 631
Renewable (TJ)	577 566	941 418
Total (TJ)	7 569 158	7 177 049
Renewable share (%)	8	13

Growth in TES	2014-19	2018-19
Non-renewable (%)	-10.8	-4.5
Renewable (%)	+63.0	+10.0
Total (%)	-5.2	-2.8

Primary energy trade	2014	2019
Imports (TJ)	6 466 161	5 868 434
Exports (TJ)	2 730 509	3 170 273
Net trade (TJ)	-3 735 652	-2 698 161

Imports (% of supply)	85	82
Exports (% of production)	60	62
Energy self-sufficiency (%)	60	71

Total energy supply in 2019

Renewable energy supply in 2019

RENEWABLE ENERGY CONSUMPTION (TFEC)

Renewable TFEC trend

Renewable energy consumption in 2019

Consumption by sector	2014	2019
Industry (TJ)	102 476	185 461
Transport (TJ)	52 571	76 571
Households (TJ)	158 421	241 671
Other (TJ)	106 670	156 177

ELECTRICITY CAPACITY

Installed capacity trend

Renewable capacity in 2021

Net capacity change (GW)

Net capacity change in 2021 (MW)

Capacity utilisation in 2020 (%)

ELECTRICITY GENERATION

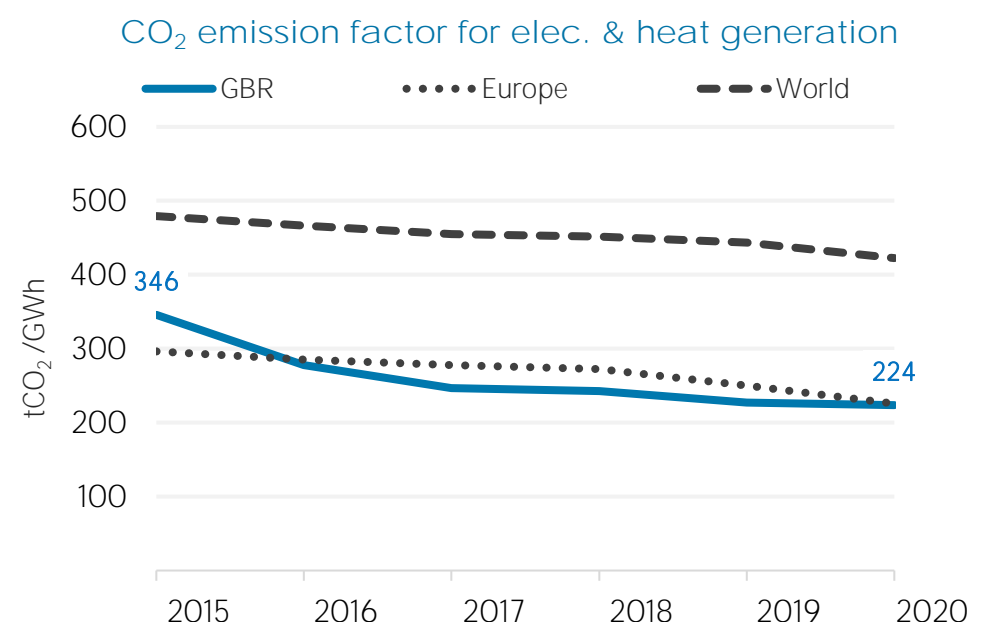

Generation in 2020	GWh	%
Non-renewable	171 675	56
Renewable	134 076	44
Hydro and marine	5 363	2
Solar	13 158	4
Wind	75 369	25
Bioenergy	40 186	13
Geothermal	0	0
Total	305 752	100

LATEST POLICIES, PROGRAMMES AND LEGISLATION

- 1 Hydrogen BECCS Innovation Programme 2022
- 2 4th round of the UK government's flagship renewable energy support scheme 2021
- 3 Banning halogen light bulbs 2021
- 4 Carbon storage capacity in Aberdeenshire 2021
- 5 EV Energy Storage Infrastructure 2021

ENERGY AND EMISSIONS

Avoided emissions based on fossil fuel mix used for power

Calculated by dividing power sector emissions by elec. + heat gen.

Distribution of solar potential

Distribution of wind potential

Biomass potential: net primary production

Indicators of renewable resource potential

Solar PV: Solar resource potential has been divided into seven classes, each representing a range of annual PV output per unit of capacity (kWh/kWp/yr). The bar chart shows the proportion of a country's land area in each of these classes and the global distribution of land area across the classes (for comparison).

Onshore wind: Potential wind power density (W/m²) is shown in the seven classes used by NREL, measured at a height of 100m. The bar chart shows the distribution of the country's land area in each of these classes compared to the global distribution of wind resources. Areas in the third class or above are considered to be a good wind resource.

Biomass: Net primary production (NPP) is the amount of carbon fixed by plants and accumulated as biomass each year. It is a basic measure of biomass productivity. The chart shows the average NPP in the country (tC/ha/yr), compared to the global average NPP of 3-4 tonnes of carbon

Sources: IRENA statistics, plus data from the following sources: UN SDG Database (original sources: WHO; World Bank; IEA; IRENA; and UNSD); UN World Population Prospects; UNSD Energy Balances; UN COMTRADE; World Bank World Development Indicators; EDGAR; REN21 Global Status Report; IEA-IRENA Joint Policies and Measures Database; IRENA Global Atlas; and World Bank Global Solar Atlas and Global Wind Atlas.

Additional notes: Capacity per capita and public investments SDGs only apply to developing areas. Energy self-sufficiency has been defined as total primary energy production divided by total primary energy supply. Energy trade includes all commodities in Chapter 27 of the Harmonised System (HS). Capacity utilisation is calculated as annual generation divided by year-end capacity x 8,760h/year. Avoided emissions from renewable power is calculated as renewable generation divided by fossil fuel generation multiplied by reported emissions from the power sector. This assumes that, if renewable power did not exist, fossil fuels would be used in its place to generate the same amount of power and using the same mix of fossil fuels. In countries and years where no fossil fuel generation occurs, an average fossil fuel emission factor has been used to calculate the avoided emissions.

These profiles have been produced to provide an overview of developments in renewable energy in different countries and areas. The IRENA statistics team would welcome comments and feedback on its structure and content, which can be sent to statistics@irena.org.
