

COUNTRY INDICATORS AND SDGS

TOTAL ENERGY SUPPLY (TES)

Total Energy Supply (TES)	2014	2019
Non-renewable (TJ)	695 627	812 031
Renewable (TJ)	214 495	231 698
Total (TJ)	910 123	1 043 730
Renewable share (%)	24	22

Growth in TES	2014-19	2018-19
Non-renewable (%)	+16.7	+4.4
Renewable (%)	+8.0	-0.7
Total (%)	+14.7	+3.2

Primary energy trade	2014	2019
Imports (TJ)	331 434	469 248
Exports (TJ)	389 897	384 228
Net trade (TJ)	58 463	- 85 020

Imports (% of supply)	36	45
Exports (% of production)	38	40
Energy self-sufficiency (%)	112	92

Total energy supply in 2019

Renewable energy supply in 2019

## RENEWABLE ENERGY CONSUMPTION (TFEC)

### Renewable TFE trend

Consumption by sector	2014	2019
Industry (TJ)	55 927	81 786
Transport (TJ)	9 327	16 525
Households (TJ)	90 078	77 612
Other (TJ)	21 907	27 724

### Renewable energy consumption in 2019

## ELECTRICITY CAPACITY

### Installed capacity trend

### Renewable capacity in 2021

### Net capacity change in 2021 (MW)

### Net capacity change (GW)

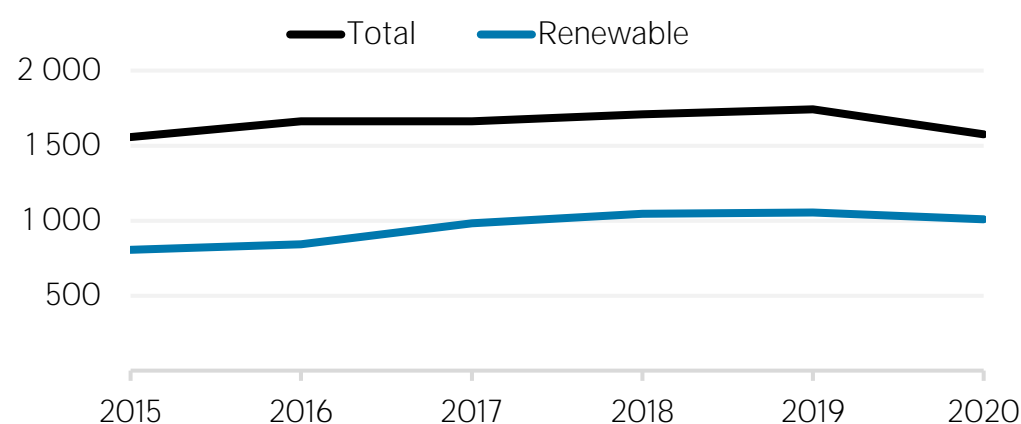

### Capacity utilisation in 2020 (%)

## ELECTRICITY GENERATION

Generation in 2020	GWh	%
<b>Non-renewable</b>	<b>18 683</b>	<b>36</b>
<b>Renewable</b>	<b>33 267</b>	<b>64</b>
Hydro and marine	30 031	58
Solar	838	2
Wind	1 814	3
Bioenergy	585	1
Geothermal	0	0
<b>Total</b>	<b>51 950</b>	<b>100</b>

Per capita electricity generation (kWh)

Electricity generation trend

## LATEST POLICIES, PROGRAMMES AND LEGISLATION

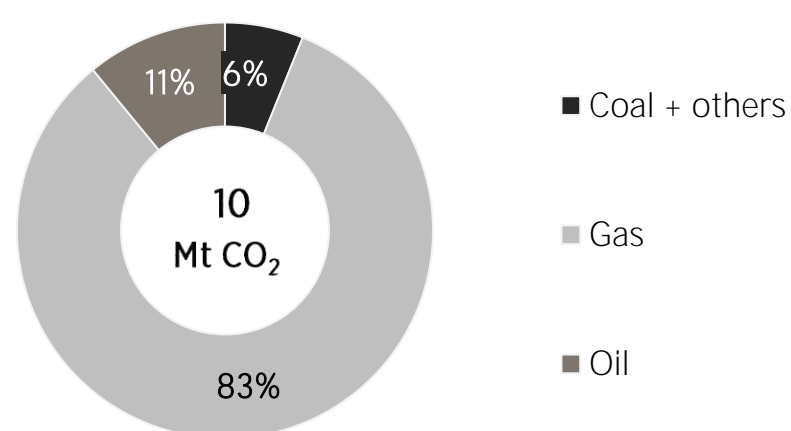

- 1 Climate Change Framework Law 2018
- 2 Measures for the efficient use of energy - Room AC, Resistive heaters, Electric instantaneous heaters, Gas instantaneous boilers 2017
- 3 Supreme Decree No 009-2017-EM: adoption of technical regulation on labelling of electrical equipment 2017
- 4 Environmental Protection Regulations for Hydrocarbon Activities - Supreme Decree N° 039-2014-EM 2014
- 5 National Photovoltaic Household Electrification Program (Programa Nacional de Electrificación Fotovoltaica Domiciliaria) 2013

## ENERGY AND EMISSIONS

Energy-related CO<sub>2</sub> emissions by sector

Elec. & heat generation CO<sub>2</sub> emissions in

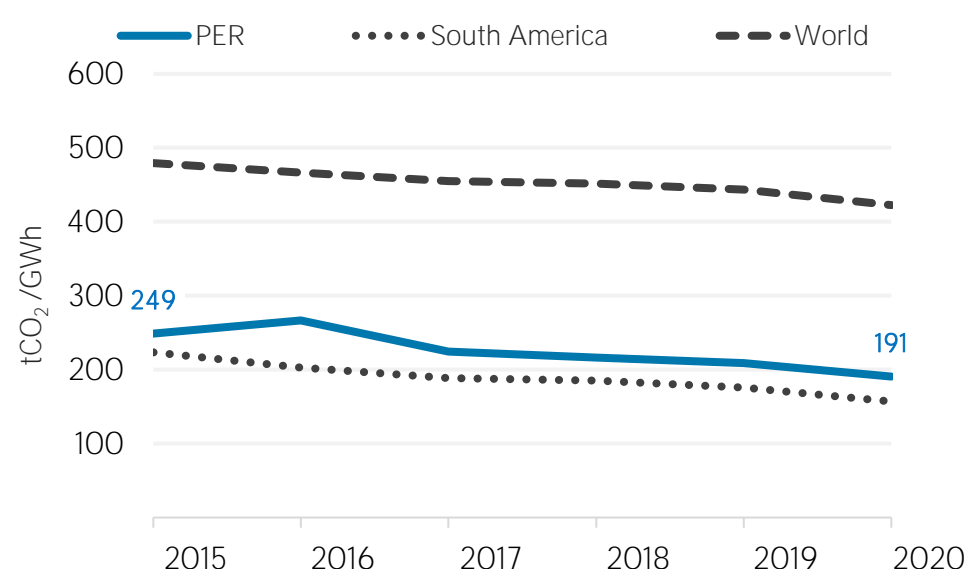

Avoided emissions from renewable elec. & heat

Avoided emissions based on fossil fuel mix used for power

CO<sub>2</sub> emission factor for elec. & heat generation

Calculated by dividing power sector emissions by elec. + heat gen.

Distribution of solar potential

Distribution of wind potential

Biomass potential: net primary production

Indicators of renewable resource potential

**Solar PV:** Solar resource potential has been divided into seven classes, each representing a range of annual PV output per unit of capacity (kWh/kWp/yr). The bar chart shows the proportion of a country's land area in each of these classes and the global distribution of land area across the classes (for comparison).

**Onshore wind:** Potential wind power density (W/m<sup>2</sup>) is shown in the seven classes used by NREL, measured at a height of 100m. The bar chart shows the distribution of the country's land area in each of these classes compared to the global distribution of wind resources. Areas in the third class or above are considered to be a good wind resource.

**Biomass:** Net primary production (NPP) is the amount of carbon fixed by plants and accumulated as biomass each year. It is a basic measure of biomass productivity. The chart shows the average NPP in the country (tC/ha/yr), compared to the global average NPP of 3-4 tonnes of carbon

**Sources:** IRENA statistics, plus data from the following sources: UN SDG Database (original sources: WHO; World Bank; IEA; IRENA; and UNSD); UN World Population Prospects; UNSD Energy Balances; UN COMTRADE; World Bank World Development Indicators; EDGAR; REN21 Global Status Report; IEA-IRENA Joint Policies and Measures Database; IRENA Global Atlas; and World Bank Global Solar Atlas and Global Wind Atlas.

**Additional notes:** Capacity per capita and public investments SDGs only apply to developing areas. Energy self-sufficiency has been defined as total primary energy production divided by total primary energy supply. Energy trade includes all commodities in Chapter 27 of the Harmonised System (HS). Capacity utilisation is calculated as annual generation divided by year-end capacity x 8,760h/year. Avoided emissions from renewable power is calculated as renewable generation divided by fossil fuel generation multiplied by reported emissions from the power sector. This assumes that, if renewable power did not exist, fossil fuels would be used in its place to generate the same amount of power and using the same mix of fossil fuels. In countries and years where no fossil fuel generation occurs, an average fossil fuel emission factor has been used to calculate the avoided emissions.

These profiles have been produced to provide an overview of developments in renewable energy in different countries and areas. The IRENA statistics team would welcome comments and feedback on its structure and content, which can be sent to [statistics@irena.org](mailto:statistics@irena.org).
