

COUNTRY INDICATORS AND SDGS

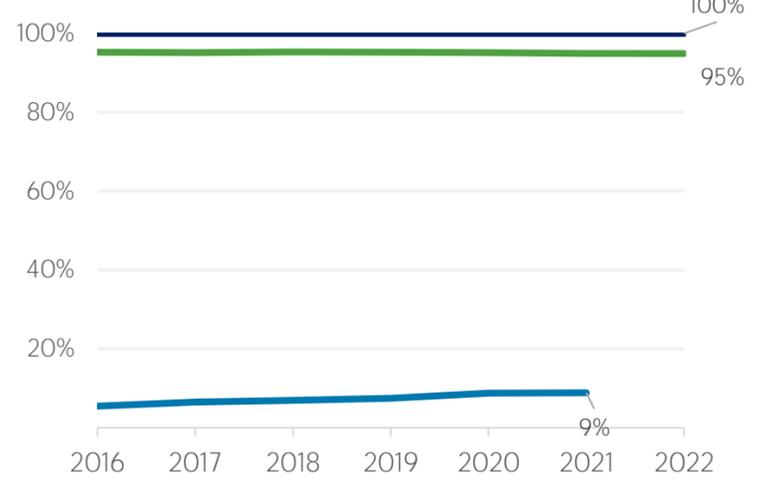

GDP per capita 8.1.1 Real GDP growth rate

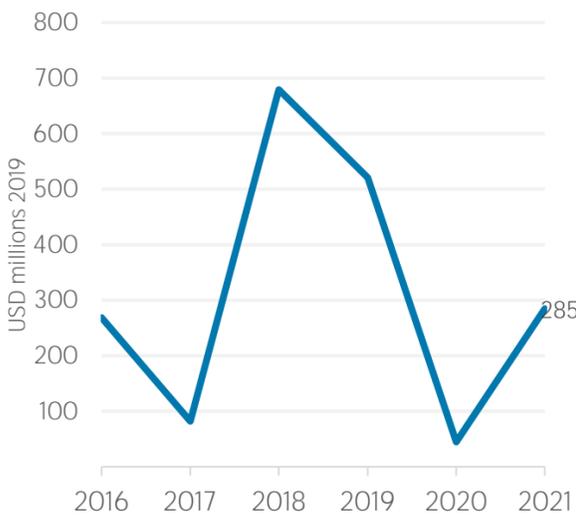

7.3.1 Energy intensity

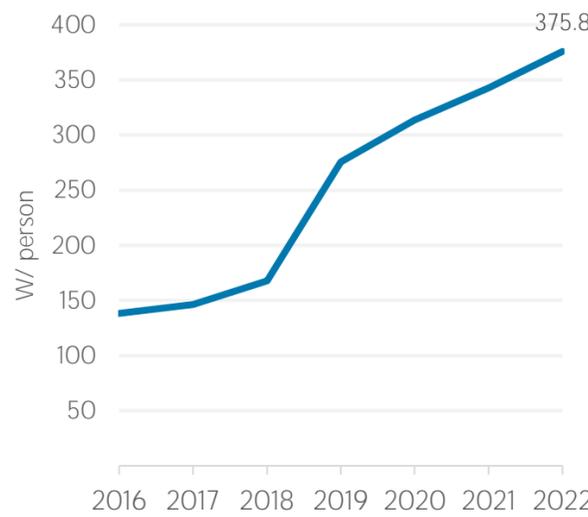

7.1.1 Access to electricity (% population)
7.1.2 Access to clean cooking (% population)
7.2.1 Renewable energy (% TFC)

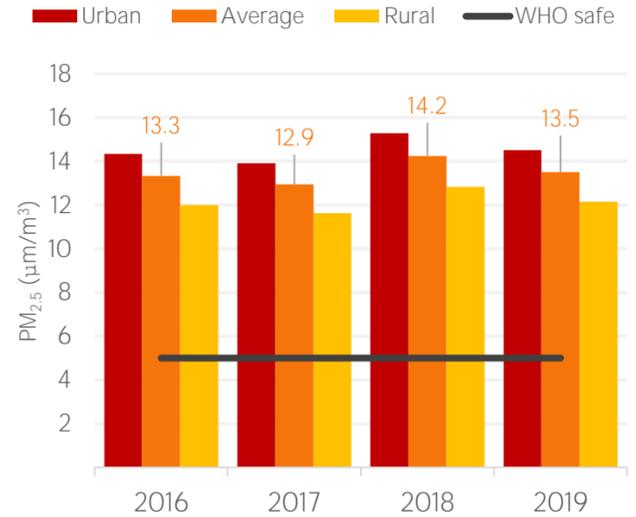

7.a.1 Public flows to renewables

7.b.1 Per capita renewable capacity

11.6.2 Air particulate matter (PM_{2.5})

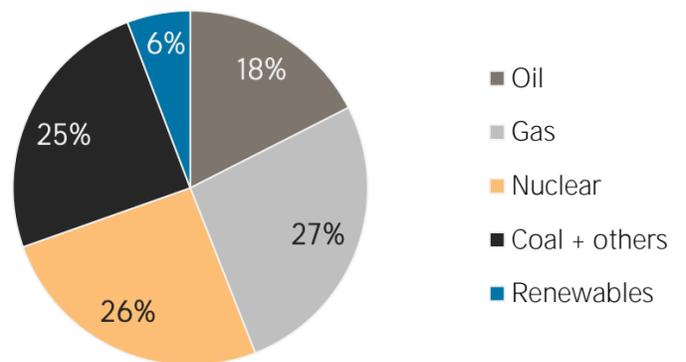

TOTAL ENERGY SUPPLY (TES)

Total Energy Supply (TES)	2016	2021
Non-renewable (TJ)	3 828 394	3 454 463
Renewable (TJ)	116 341	211 175
Total (TJ)	3 944 735	3 665 638
Renewable share (%)	3	6

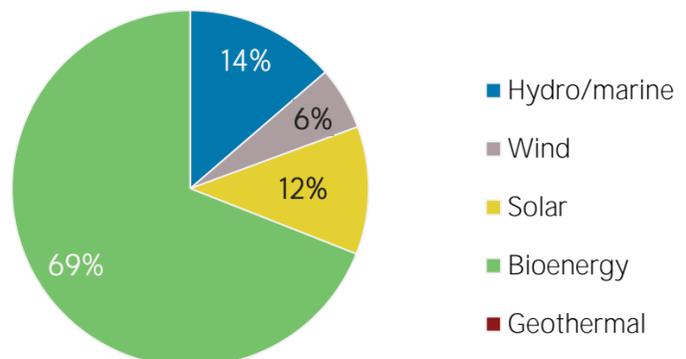

Growth in TES	2016-21	2020-21
Non-renewable (%)	-9.8	+6.1
Renewable (%)	+81.5	+5.9
Total (%)	-7.1	+6.1

Primary energy trade	2016	2021
Imports (TJ)	1 245 566	1 358 466
Exports (TJ)	53 869	47 834
Net trade (TJ)	-1 191 697	-1 310 632
Imports (% of supply)	32	37
Exports (% of production)	2	2
Energy self-sufficiency (%)	69	61

Total energy supply in 2021

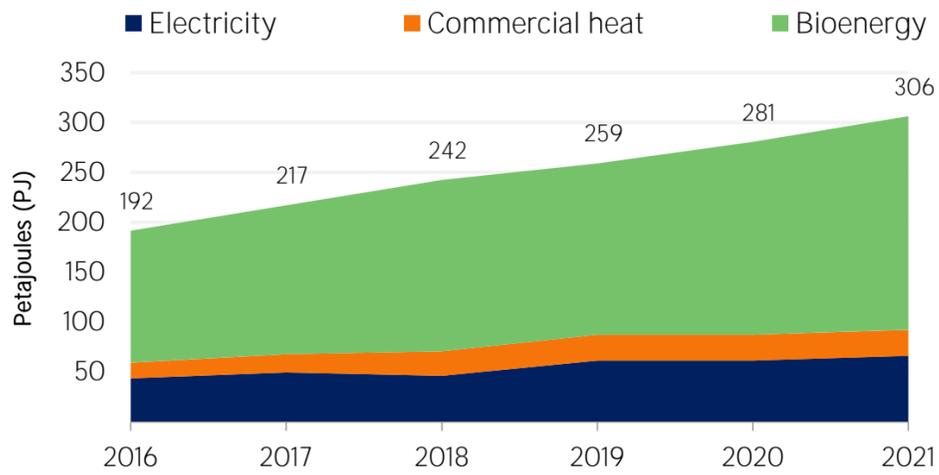

Renewable energy supply in 2021

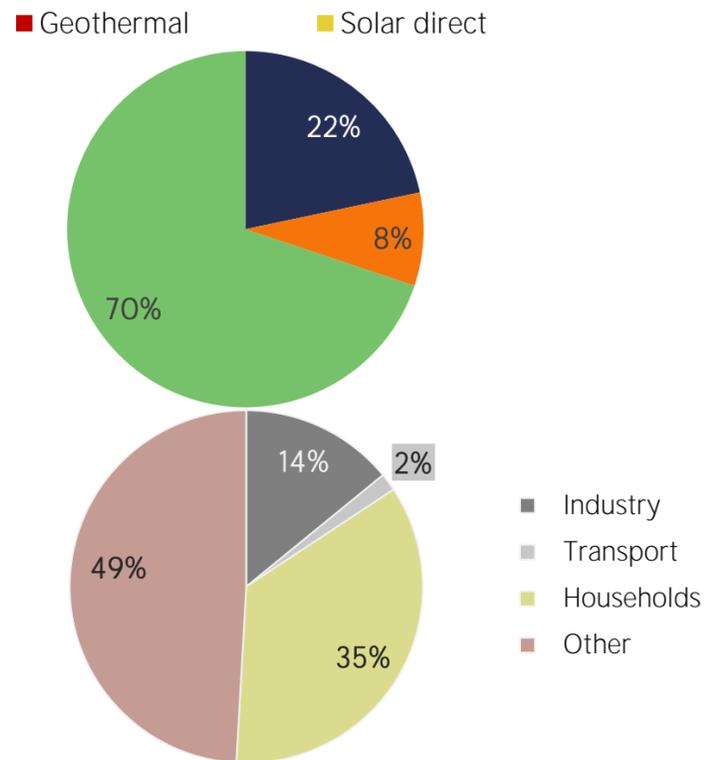

RENEWABLE ENERGY CONSUMPTION (TFEC)

Renewable TFE trend

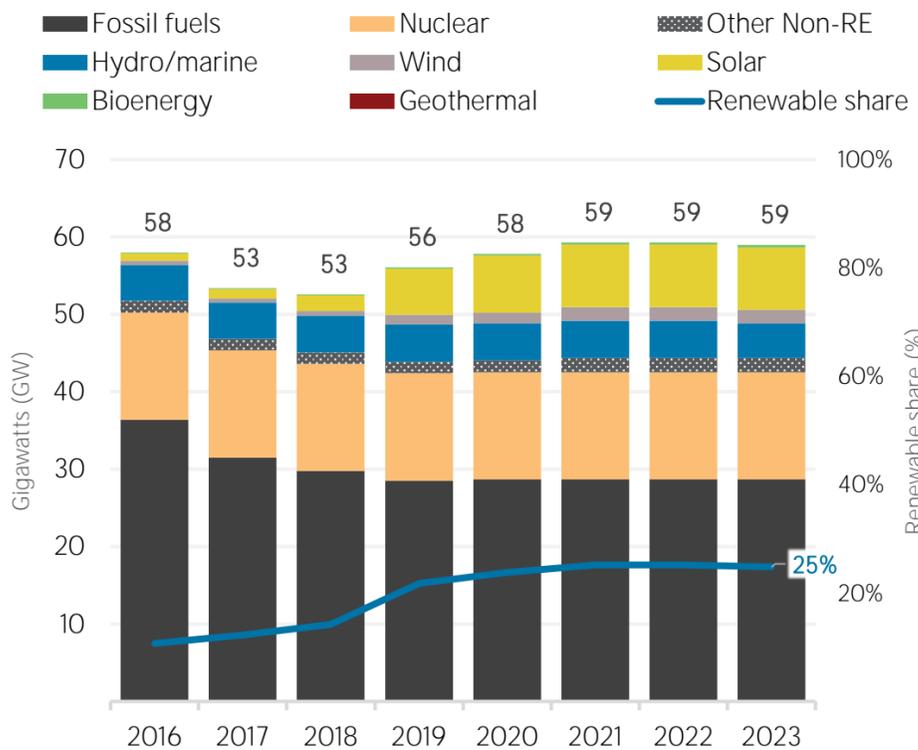

Consumption by sector	2016	2021
Industry (TJ)	24 974	43 178
Transport (TJ)	4 252	4 949
Households (TJ)	92 579	107 784
Other (TJ)	69 859	150 404

Renewable energy consumption in 2021

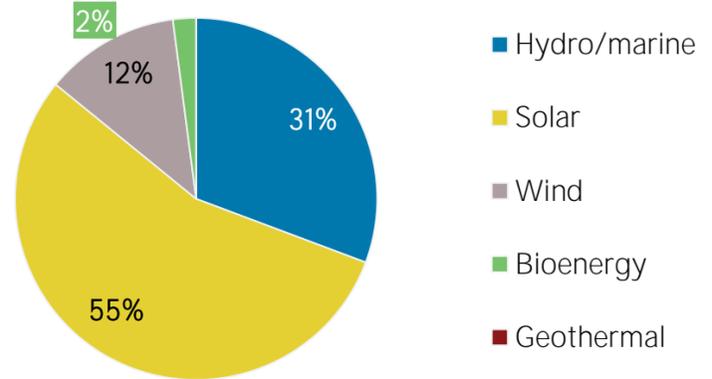

ELECTRICITY CAPACITY

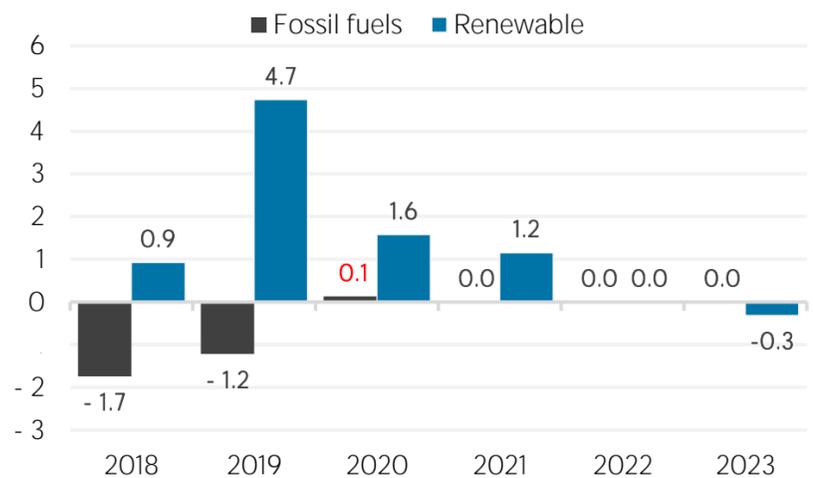

Installed capacity trend

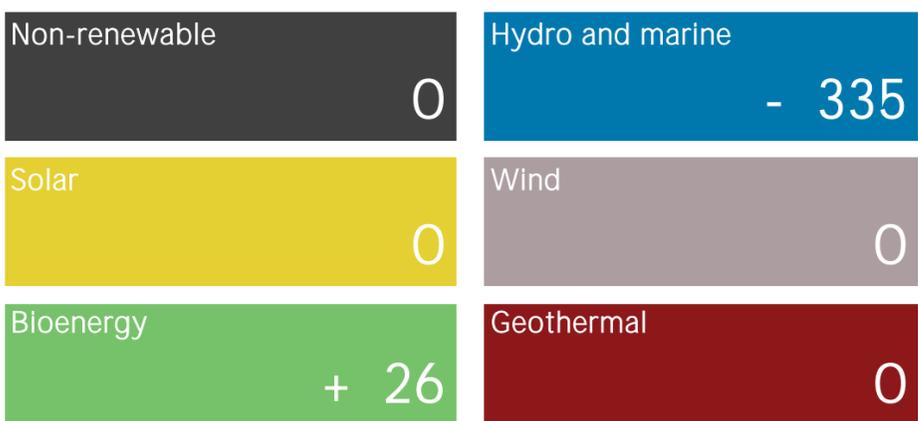

Renewable capacity in 2023

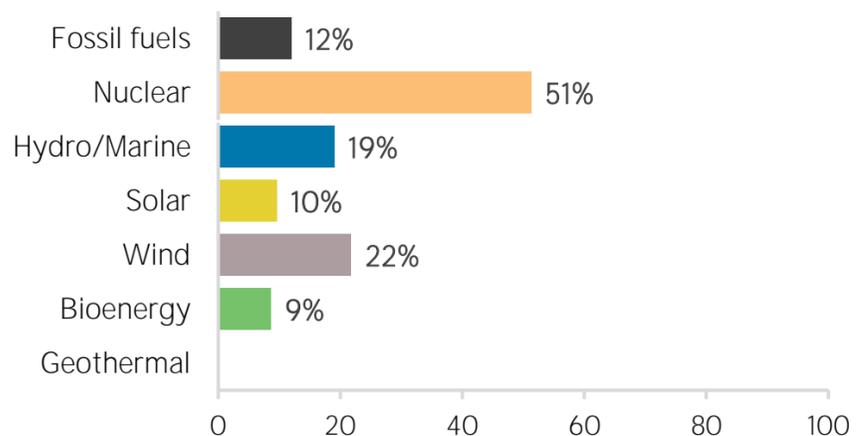

Net capacity change (GW)

Net capacity change in 2023 (MW)

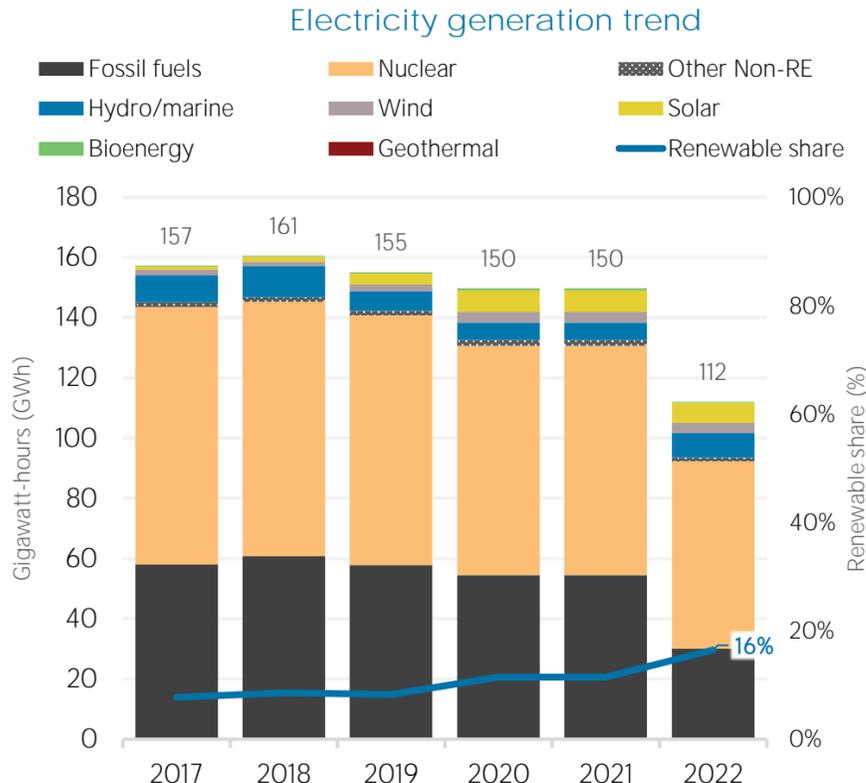

Capacity utilisation in 2022 (%)

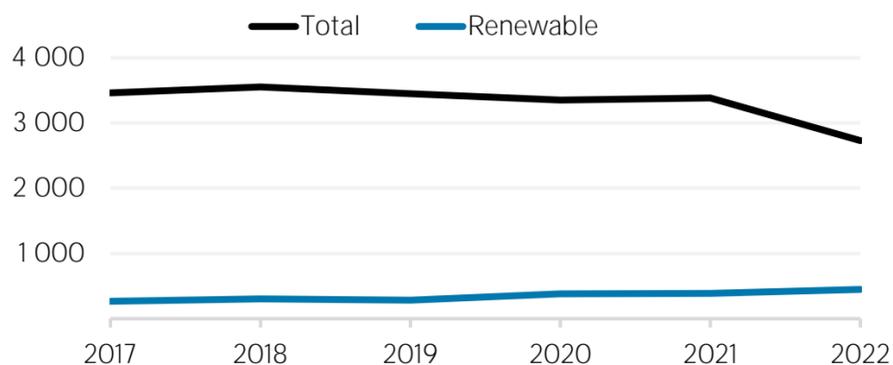

ELECTRICITY GENERATION

Generation in 2022	GWh	%
Non-renewable	93 600	84
Renewable	18 451	16
Hydro and marine	8 051	7
Solar	6 832	6
Wind	3 359	3
Bioenergy	209	0
Geothermal	0	0
Total	112 051	100

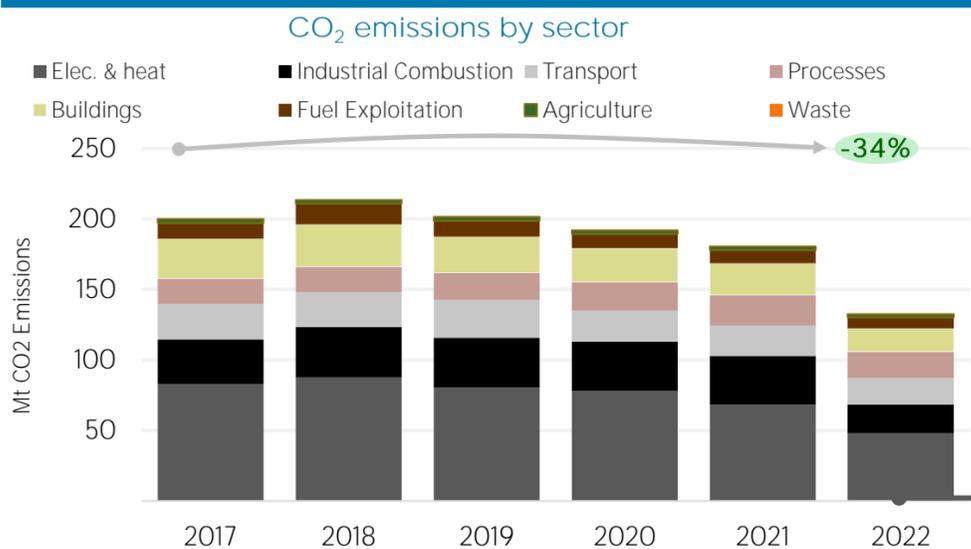

Per capita electricity generation (kWh)

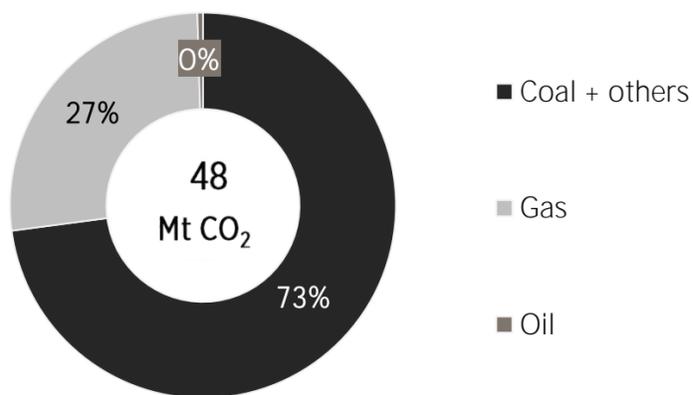

LATEST POLICIES, PROGRAMMES AND LEGISLATION

- 1 Amendment to the Subsoil Use Law 2023
- 2 Ukraine Critical Minerals List for Production Sharing Agreements 2023
- 3 State support for investment projects with significant investments in Ukraine (Law No. 1116) 2022
- 4 Ukraine - EU Strategic Partnership on Raw Materials 2021
- 5 National energy efficiency goals for 2020 2019

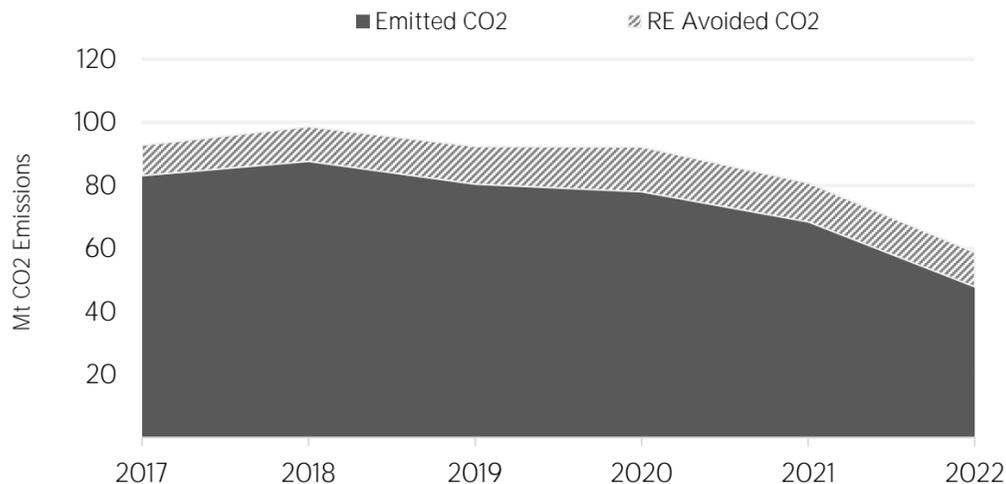

ENERGY AND EMISSIONS

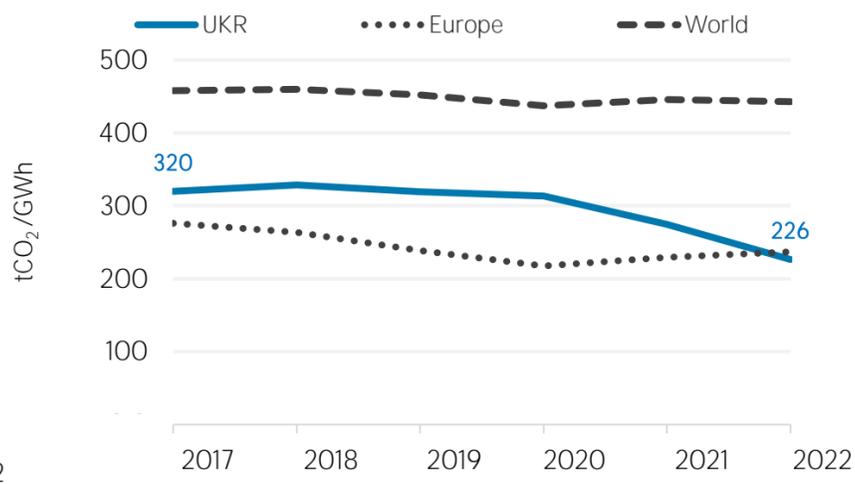

Elec. & heat generation CO₂ emissions in

Avoided emissions from renewable elec. & heat

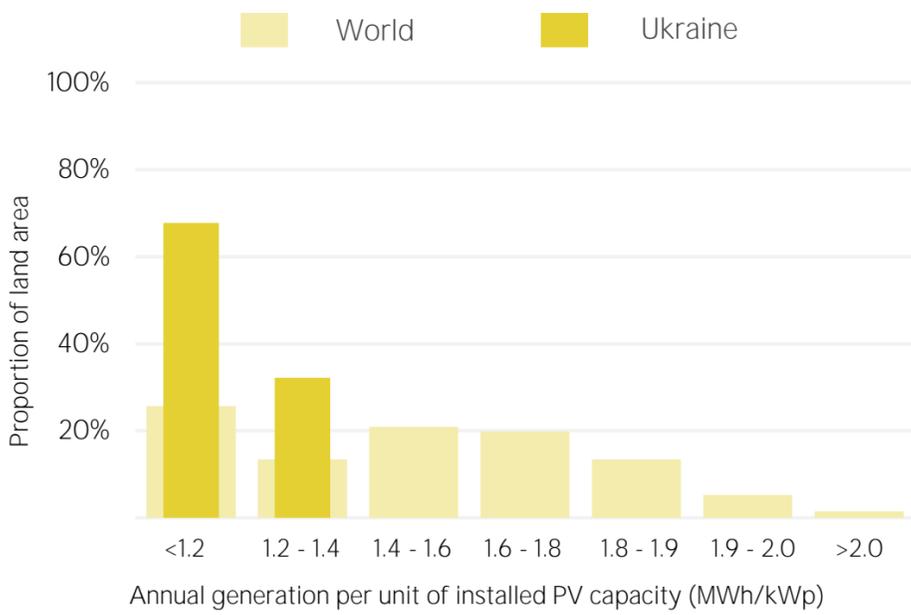

CO₂ emission factor for elec. & heat generation

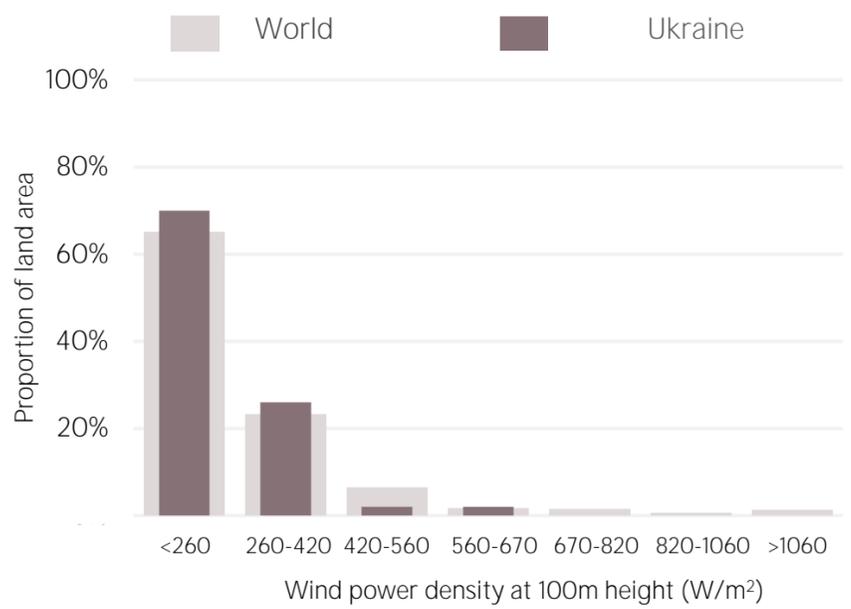

Avoided emissions based on fossil fuel mix used for power

Calculated by dividing power sector emissions by elec. + heat gen.

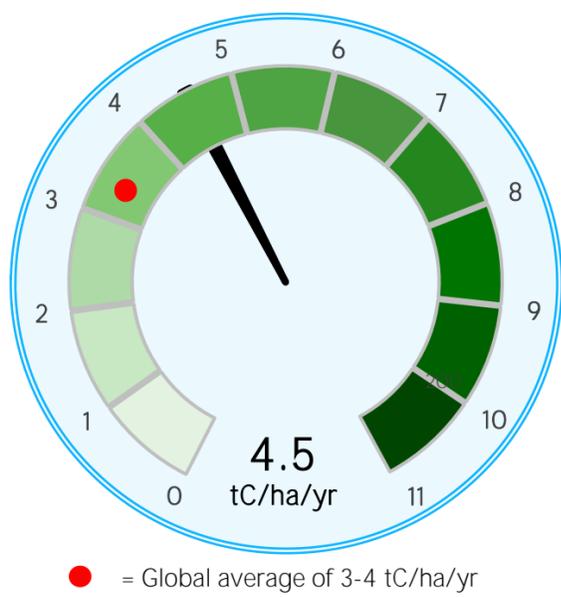

Distribution of solar potential

Distribution of wind potential

Biomass potential: net primary production

Indicators of renewable resource potential

Solar PV: Solar resource potential has been divided into seven classes, each representing a range of annual PV output per unit of capacity (kWh/kWp/yr). The bar chart shows the proportion of a country's land area in each of these classes and the global distribution of land area across the classes (for comparison).

Onshore wind: Potential wind power density (W/m²) is shown in the seven classes used by NREL, measured at a height of 100m. The bar chart shows the distribution of the country's land area in each of these classes compared to the global distribution of wind resources. Areas in the third class or above are considered to be a good wind resource.

Biomass: Net primary production (NPP) is the amount of carbon fixed by plants and accumulated as biomass each year. It is a basic measure of biomass productivity. The chart shows the average NPP in the country (tC/ha/yr), compared to the global average NPP of 3-4 tonnes of carbon

Sources: IRENA statistics, plus data from the following sources: UN SDG Database (original sources: WHO; World Bank; IEA; IRENA; and UNSD); UN World Population Prospects; UNSD Energy Balances; UN COMTRADE; World Bank World Development Indicators; EDGAR; REN21 Global Status Report; IEA-IRENA Joint Policies and Measures Database; IRENA Global Atlas; and World Bank Global Solar Atlas and Global Wind Atlas.

Additional notes: Capacity per capita and public investments SDGs only apply to developing areas. Energy self-sufficiency has been defined as total primary energy production divided by total primary energy supply. Energy trade includes all commodities in Chapter 27 of the Harmonised System (HS). Capacity utilisation is calculated as annual generation divided by year-end capacity x 8,760h/year. Avoided emissions from renewable power is calculated as renewable generation divided by fossil fuel generation multiplied by reported emissions from the power sector. This assumes that, if renewable power did not exist, fossil fuels would be used in its place to generate the same amount of power and using the same mix of fossil fuels. In countries and years where no fossil fuel generation occurs, an average fossil fuel emission factor has been used to calculate the avoided emissions.

These profiles have been produced to provide an overview of developments in renewable energy in different countries and areas. The IRENA statistics team would welcome comments and feedback on its structure and content, which can be sent to statistics@irena.org.
