# Solutions to decarbonise the shipping and aviation sectors

In partnership with

26 September 2023 | 14:00

#IIW2023

# Scene-setting Presentation

**Pierpaolo Cazzola**

Director – European Transport and Energy Research Center  
Institute of Transportation Studies at UC Davis

- Transport plays a vital role in the world's economy, but it is also a major source of emissions: 23% of energy-related GHG emissions globally, and close to a third once indirect emissions (vehicle manufacture, fuel production, infrastructure construction) are included

## Global CO<sub>2</sub> emissions from transport

This is based on global transport emissions in 2018, which totalled 8 billion tonnes CO<sub>2</sub>. Transport accounts for 24% of CO<sub>2</sub> emissions from energy.

Our World  
in Data

OurWorldinData.org – Research and data to make progress against the world's largest problems.

Data Source: Our World in Data based on International Energy Agency (IEA) and the International Council on Clean Transportation (ICCT).

Licensed under CC-BY by the author Hannah Ritchie.

- Energy combustion emissions from shipping and aviation currently account for over 5% of GHG emissions (fairly evenly split)
- This share will grow as road transport decarbonizes
- For aviation, it comes with important additional climate forcing pressure (due to non-CO<sub>2</sub> effects)

## Important commonalities

- International relevance + presence of ad-hoc international “regulator” (IMO, ICAO)
- Major importance of long distance trips
- Poor track record regarding fuel taxation and meaningful carbon pricing (with few exceptions)

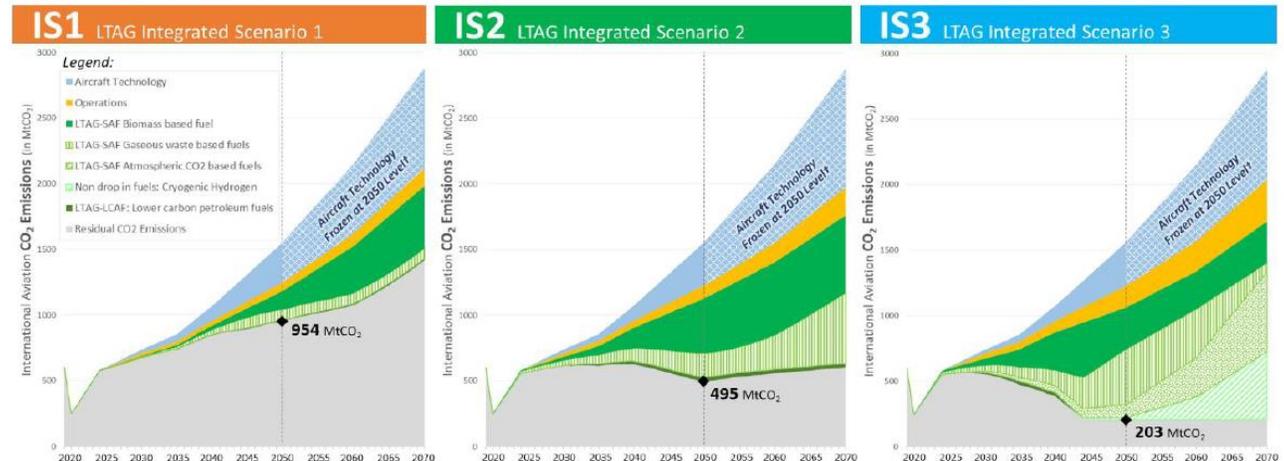

## Decarbonisation needs to be articulated on three main areas of action

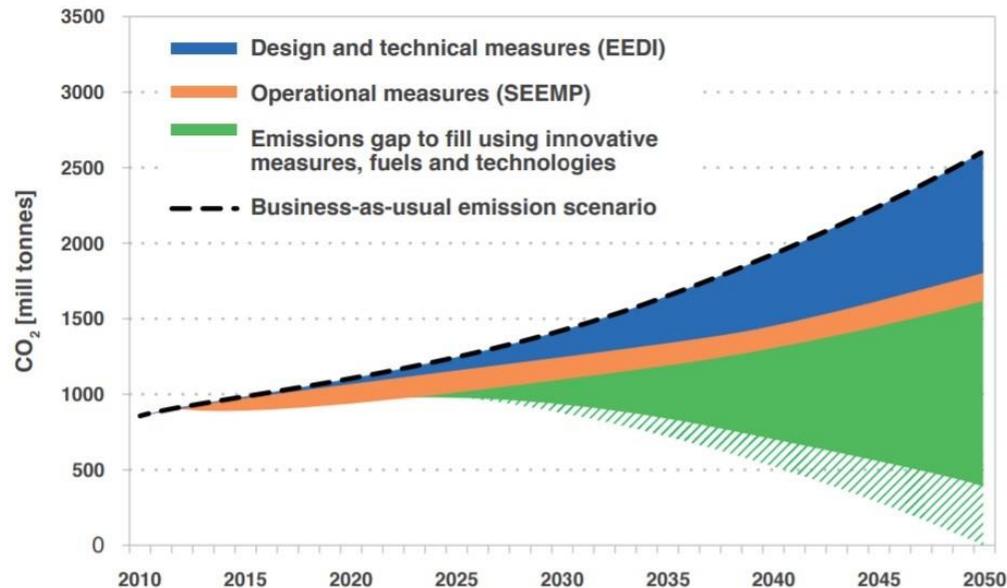

- The management of travel demand
  - The enhancement of the energy efficiency
  - The reduction of the fossil carbon content of energy vectors/fuels, in line with IPCC (IPCC is also clear on the fact that carbon dioxide removals are needed for complementary measures)
- Operational and technical solutions

→ Need for coordinated action for vessels, energy/fuels & infrastructure

# Technology options to decarbonize shipping and aviation

† Caution required with the interpretation of absolute CO<sub>2</sub> emissions levels after 2050 due to modelling assumptions e.g., frozen aircraft technology after 2050. Under these assumptions, CO<sub>2</sub> emissions are higher than in an alternative scenario (and modelling approach) where aircraft technology would continue to improve after 2050.

Technical solutions for efficiency improvements

Operational improvements

Fuel switching

Requiring carbon negative approaches (offsets)

# Zoom into fuel options

Need to account for multiple needs:

- Technology readiness and technical feasibility (including safety aspects)
- Availability, at scale and in line with sustainability requirements (with respect to GHG emission abatement, on a life-cycle basis, energy efficiency, water and land use requirements)
- Cost, with a focus of total cost of ownership and operation

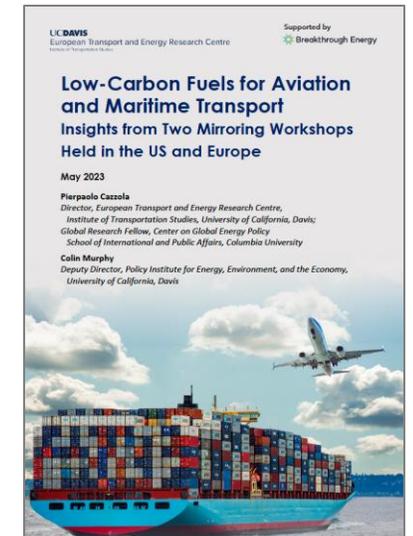

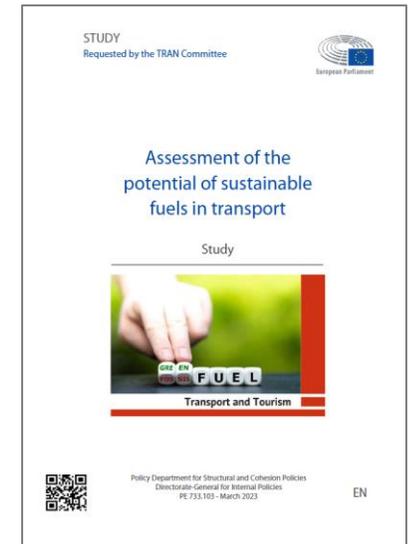

- High priority (technically feasible, suitable, economically competitive)
- Low priority (technically feasible but not very suitable, economically suboptimal)
- Not a priority (subject to major technical restrictions, limited economic competitiveness)
- Uncertain (at present, subject to technical and economic restrictions, albeit with a considerable potential, requires research and deployment support)

Source: adapted from <https://www.nature.com/articles/d43978-022-00098-x>

# In words...

- For both cost and resource efficiency reasons, the shift to sustainable fuels should be first driven by a significant increase in **energy efficiency**
- **Direct electrification** from renewable and other low-carbon resources is the best option for the decarbonisation of **road transport and short haul shipping**, due to lower cost, better energy efficiency and – with economic circularity – resource requirements vs. competing alternatives
- **Liquid and gaseous sustainable fuels** should be primarily dedicated to transport sub-sectors that cannot be easily electrified, i.e. **aviation, shipping**, and – possibly – part of heavy-duty road transport

Sources:

[https://www.europarl.europa.eu/thinktank/en/document/IPOL\\_STU\(2023\)733103](https://www.europarl.europa.eu/thinktank/en/document/IPOL_STU(2023)733103)

<https://doi.org/10.7922/G2SB442Z>

- **Biofuels** are cheaper than renewable e-liquids, but they face availability limitations and competing demand in the bio-economy and sustainability constraints with respect to land use
- **Hydrogen** could be used as an energy carrier (with storage challenges) or a feedstock for PBtL and e-fuels (RFNBOs), but it needs to be produced from low-carbon pathways (requiring very carbon electricity and very cheap forms of primary energy)
- **Renewable e-liquids** are interesting options for both aviation and shipping
  - Blendable e-hydrocarbons (drop-in) are needed for SAF; they can also be used by ships (cost/energy efficiency challenge)
  - E-ammonia and e-methanol are competitive candidates for maritime fuels, although their adoption remains uncertain: safety issues are currently a barrier for ammonia, and the sourcing of carbon can be challenge for methanol
- **Fossil fuels with emissions offsetting** (including but not limited to DACCS) may outcompete e-fuels (if also reliant on DAC), but there are scale constraints for DAC, due to volumes of air to be processed and need for large low-carbon heat inputs

- Focusing in least-cost is crucial to maximise development opportunities and/or minimize economic drawbacks
- While there is a tendency on near-term focus in policymaking, looking at structural long-term aspects (availability, modularity and its cost implications) is important to anticipate change, de-risk investments meant to seize opportunities and steer the economy towards greater competitiveness
- Carbon pricing is key for signals on efficiency and fuel switching investments, even if not sufficient (and also far from being universally adopted)
- The support of innovation and technological development (best if funded by carbon pricing) is crucial for sustainable aviation and shipping fuels that can leverage large scale feedstock availability

# The role of renewables in decarbonising the shipping and aviation sectors

IRENA Innovation Week

Day 2 – Solutions to decarbonise the shipping and aviation sectors

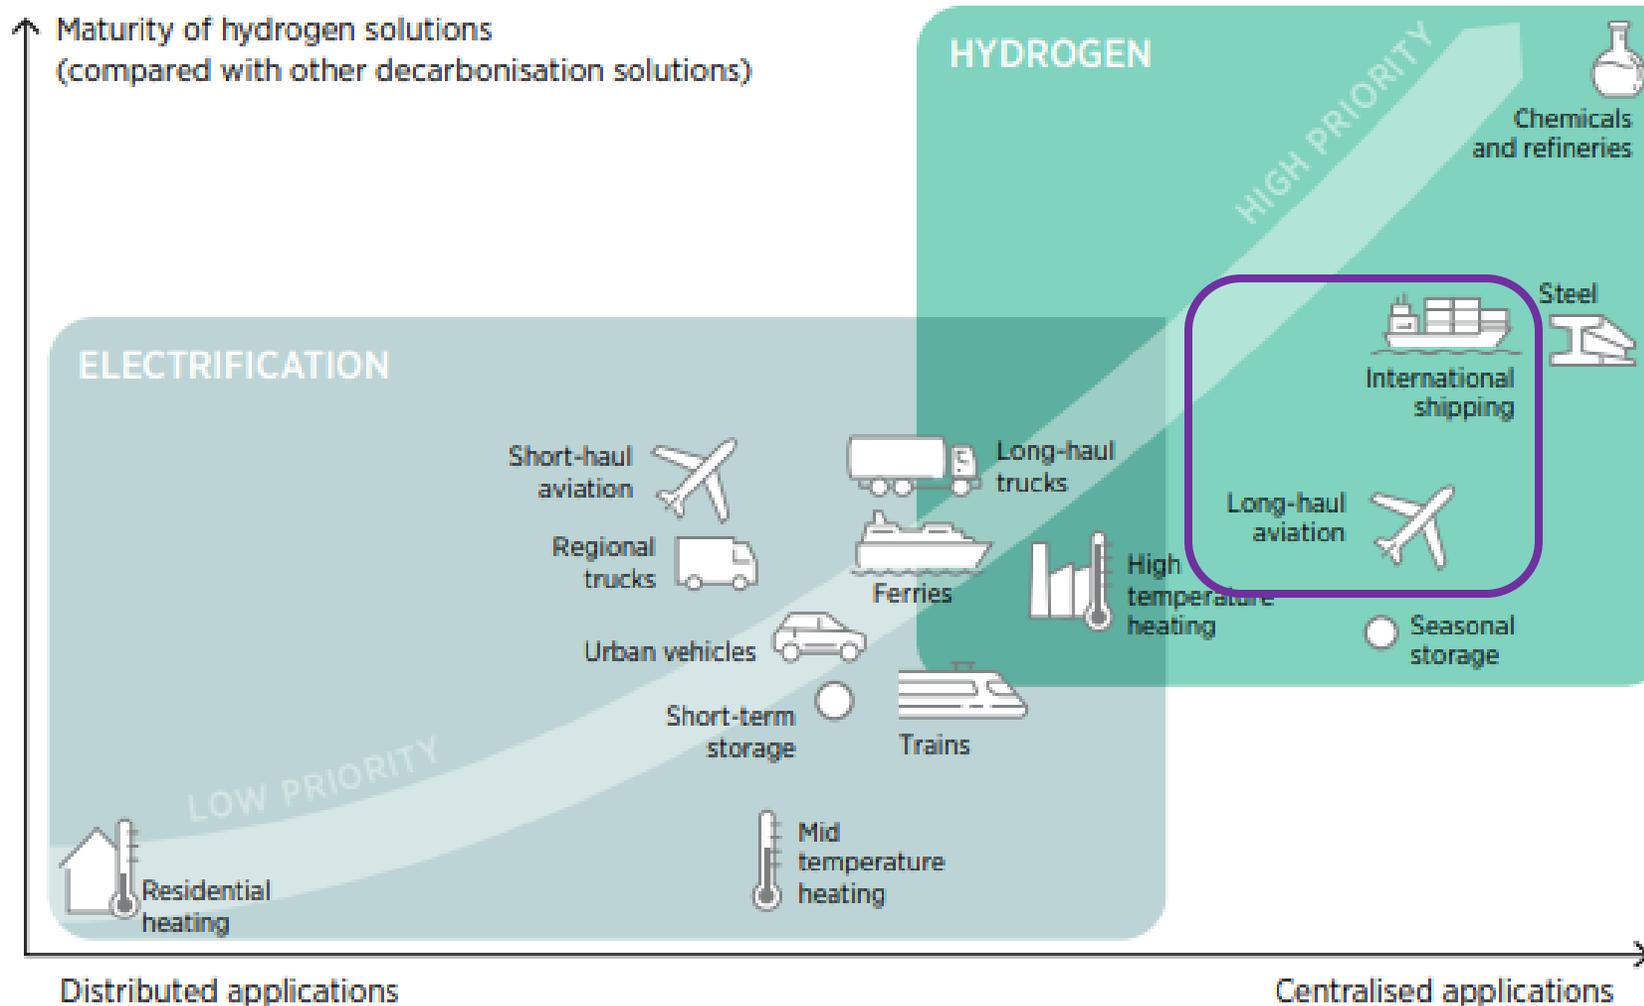

26 September 2023

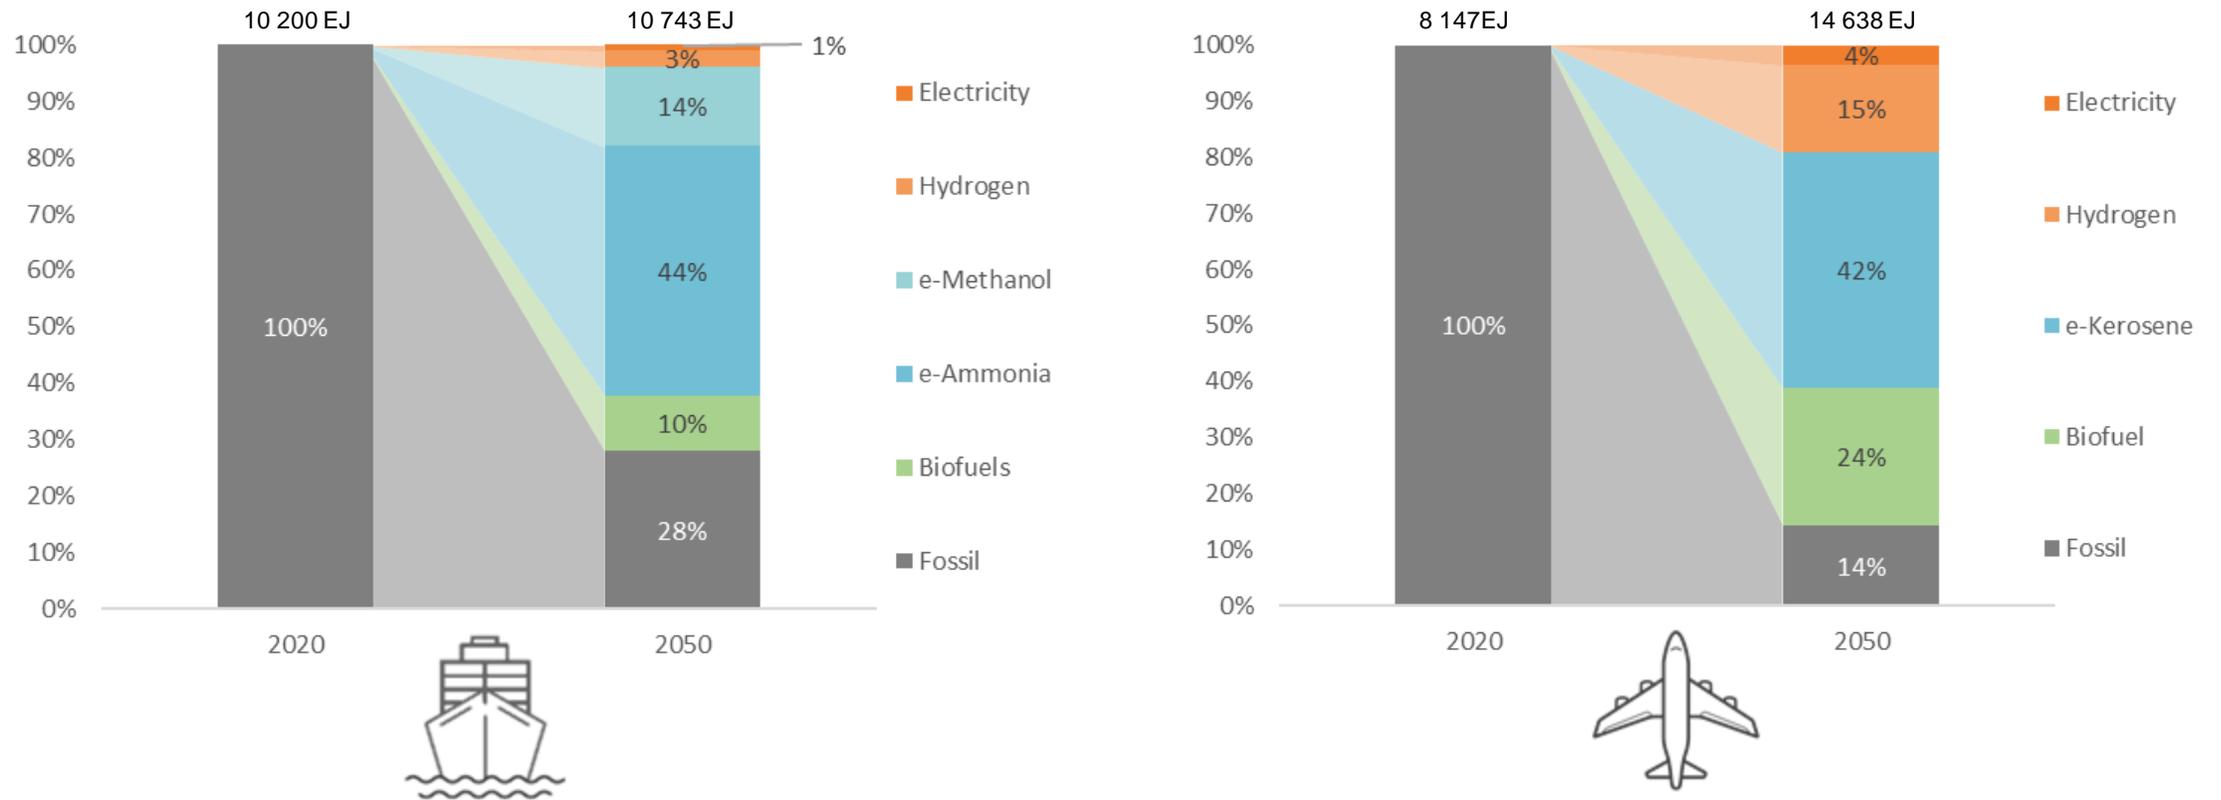

**Carlos Ruiz**  
Programme Officer – Innovation and  
End-use Sectors

# H<sub>2</sub> based fuels are not equally suitable for all sectors

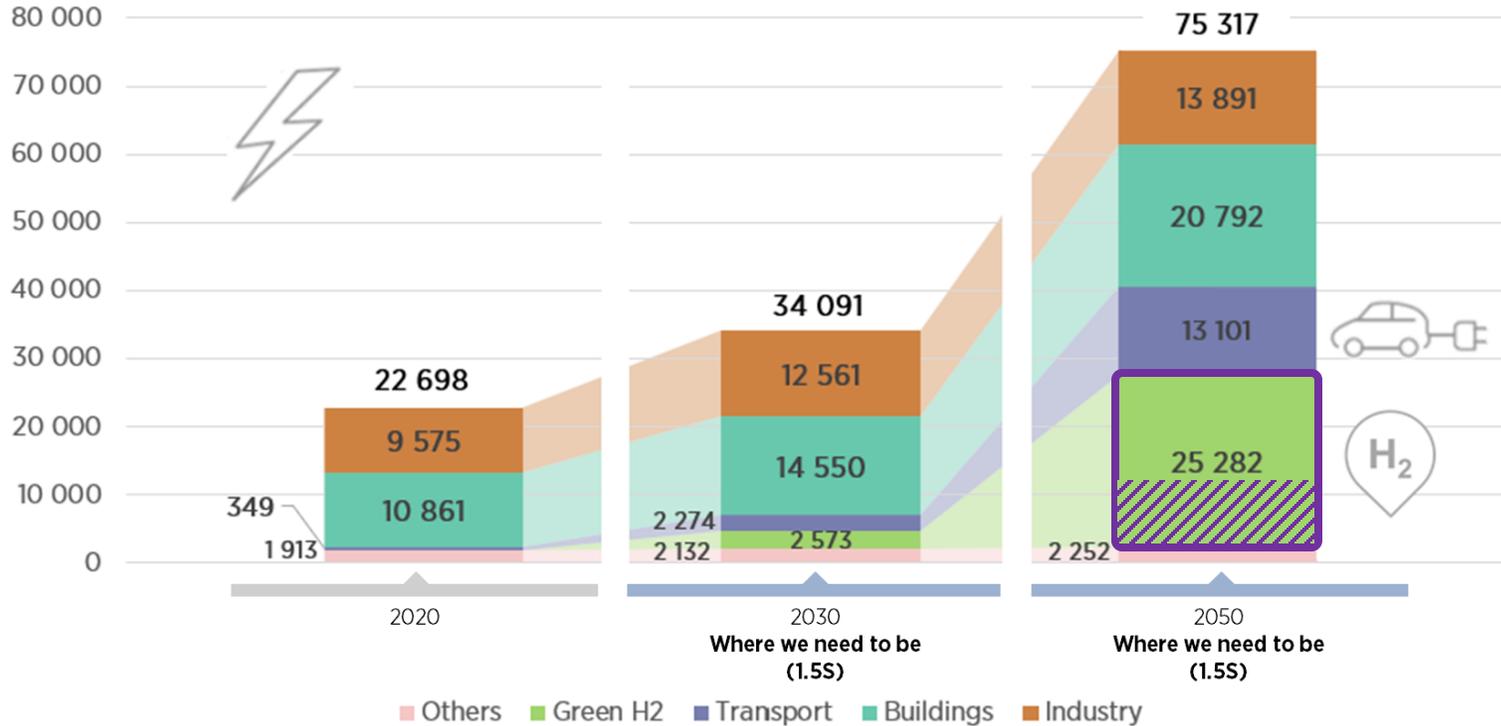

# Shipping and aviation have similar paths to net-zero

1. Reduced demand and improved energy efficiency
2. Direct use of clean electricity
3. Direct use of bioenergy
4. Indirect use of clean electricity via e-fuels

# Electricity demand for e-fuel production will grow exponentially

Electricity consumption by end-use sector (TWh/yr) in the 1.5°C Scenario

By 2050:

- H<sub>2</sub> supply reaching **530 Mt/yr** (6x growth)
- **Shipping and aviation** expected to consume **~170 Mt/yr** (roughly a third)
- Electricity consumption to grow **3.3x**
- **Renewable resources are plentiful**, the key is the timely planning of their deployment.

# Synthetic fuels are still in their early stages

- Supply and demand for synthetic fuels needs to be built up in parallel across all end-use sectors.
  - The timely development of necessary infrastructure is critical.
  - Harmonised certification of green fuels and safety standards to further enable trade and investments.
- Long term clarity on policy and regulation is needed.
- International cooperation between governments is important, but also between public/private sectors and across end-use sectors.
  - Collaborative instruments, such as green corridors are emerging and helping to demonstrate and scale decarbonisation efforts.

# Brief on Green Power Conversion Industry in SPIC

- **State Power Investment Corporation (SPIC)**, is one of China's five largest power generation groups, with over **120,000** employees and **€ 200 billion** assets.
- **SPIC** manages overall power capacity of **237 GW**, with renewable energy installed capacity of **160 GW**.

# Brief on Green Power Conversion Industry in SPIC

SPIC establishes ‘**green power conversion**’ as one of the five pillar industries

## Renewable Energy

Largest Renewable Power company globally

Solar PV installed capacity

**67,810 MW**

**No.1 globally**

Wind power installed capacity

**48,410 MW**

**No.2 globally**

## Biomass

Largest Biomass power company nationally

Biomass power generation

**(20 million ton/year)**

**44** plants

**No.1 nationally**

Waste power generation

**21** plants

## Hydrogen

Leading hydrogen energy company nationally

- Technology leader of fuel cell
- Independent development of PEM water electrolysis equipment (200Nm<sup>3</sup>/h)
- Hydrogen transport in natural gas pipelines
- Hydrogen internal combustion engine

## CCUS

Leading CCUS company nationally

China's first 10000 ton/year CCS project

**Coal-fired**

Regeneration heat  $\leq 2.4\text{GJ/tCO}_2$

Solvent loss  $\leq 0.8\text{kg/tCO}_2$

**Gas-fired**

Regeneration heat  $\leq 3.0\text{GJ/tCO}_2$

Solvent loss  $\leq 2.0\text{kg/tCO}_2$

## Shipping industry

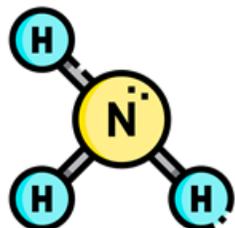

- IMO (International Maritime Organization) plan to reduce 20% carbon emission by 2030, and achieve zero emission by 2050.
- Green NH<sub>3</sub> and green methanol are important solutions to achieve the goal. Many leading shipping companies are planning to equip NH<sub>3</sub> and methanol engines on their ships. The demand on green methanol is expected to be 3 million tons by 2025.

## Aviation industry

- REDII released by European Commission requires 2% of SAF (Sustainable Aviation Fuel) blending by 2025 and 63% of SAF blending by 2050.
- IATA (International Air Transport Association) plans to achieve zero emission by 2050, meaning **350 million tons SAF** demand.

| Year | EU aviation fuel demand/ Mt | SAF            |            | RFNBOs         |            |
|------|-----------------------------|----------------|------------|----------------|------------|
|      |                             | blending ratio | demand/ Mt | blending ratio | demand/ Mt |
| 2025 | 6800                        | 2%             | 140        | -              | -          |
| 2030 | 7150                        | 5%             | 350        | 0.7%           | 50         |
| 2050 | 8700                        | 63%            | 5500       | 28%            | 2450       |

# Layout of green NH<sub>3</sub> industry

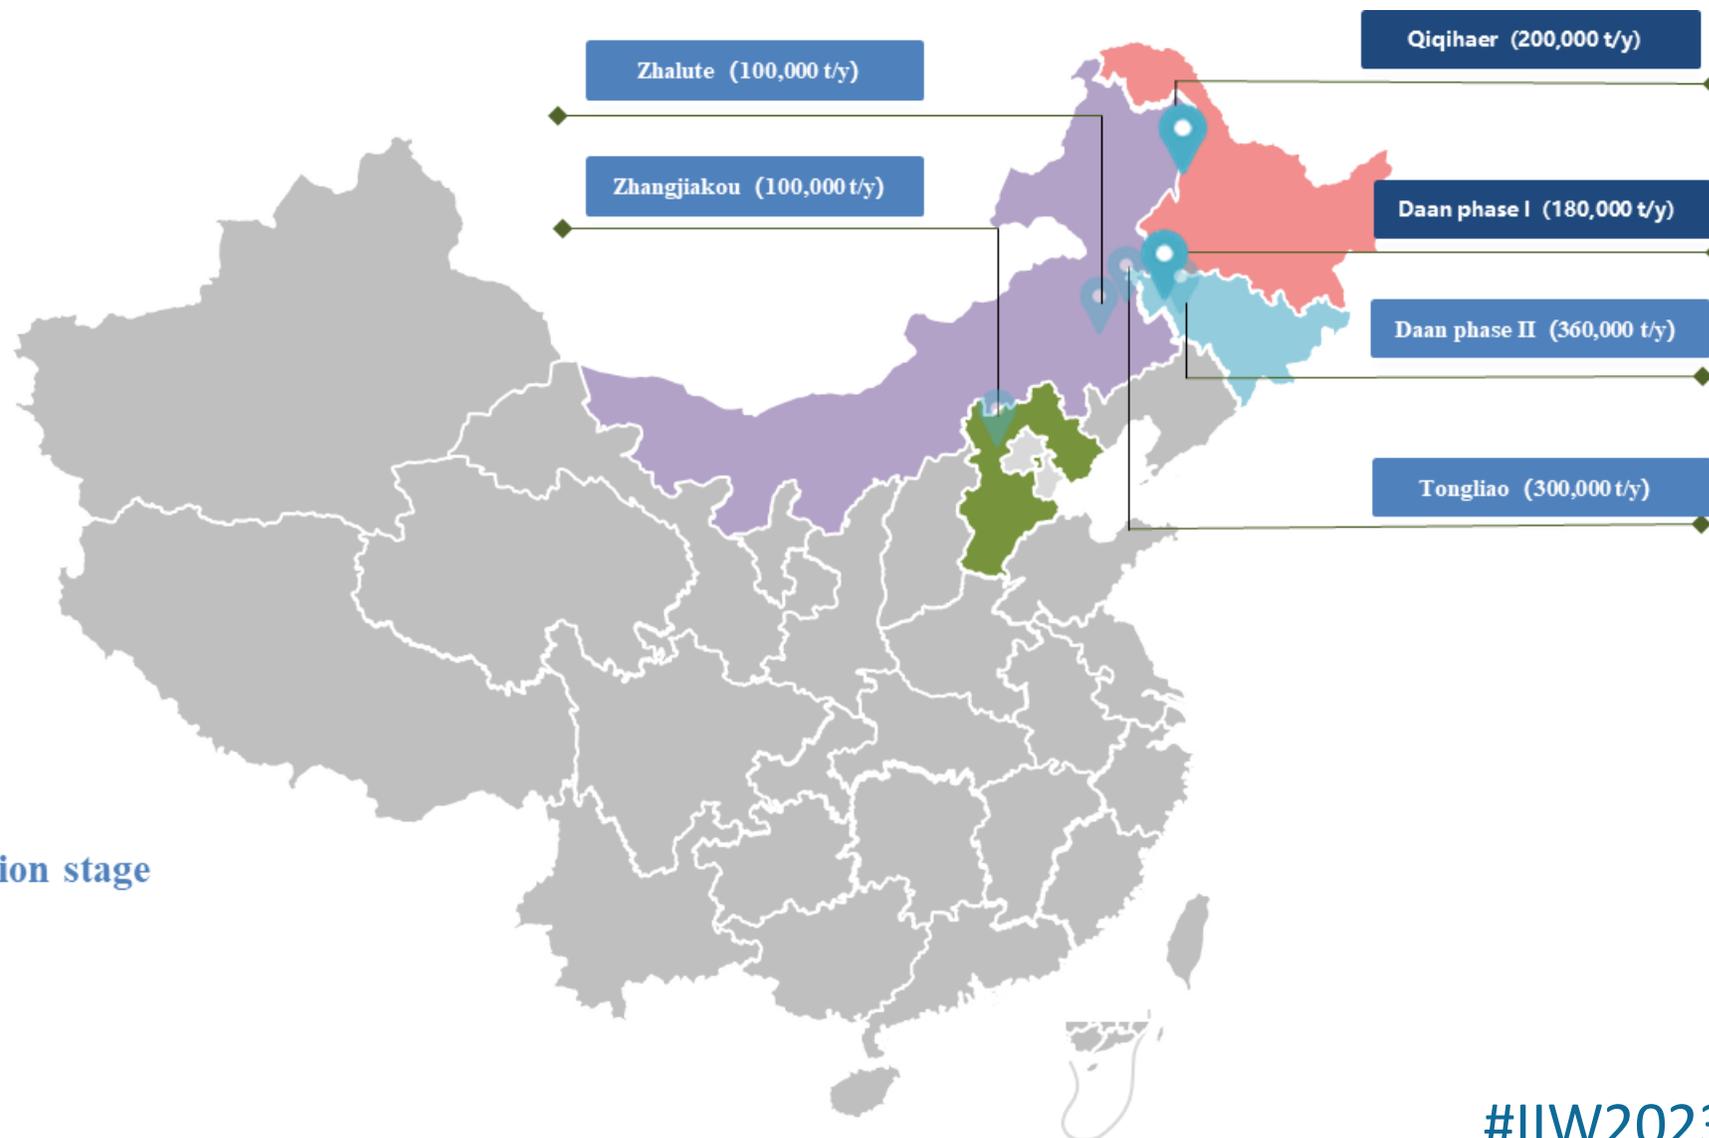

## Green ammonia

Located in northeast of China

 Quota granted projects  
(380,000 t/y)

 Not granted yet, in negotiation stage  
(1260,000 t/y)

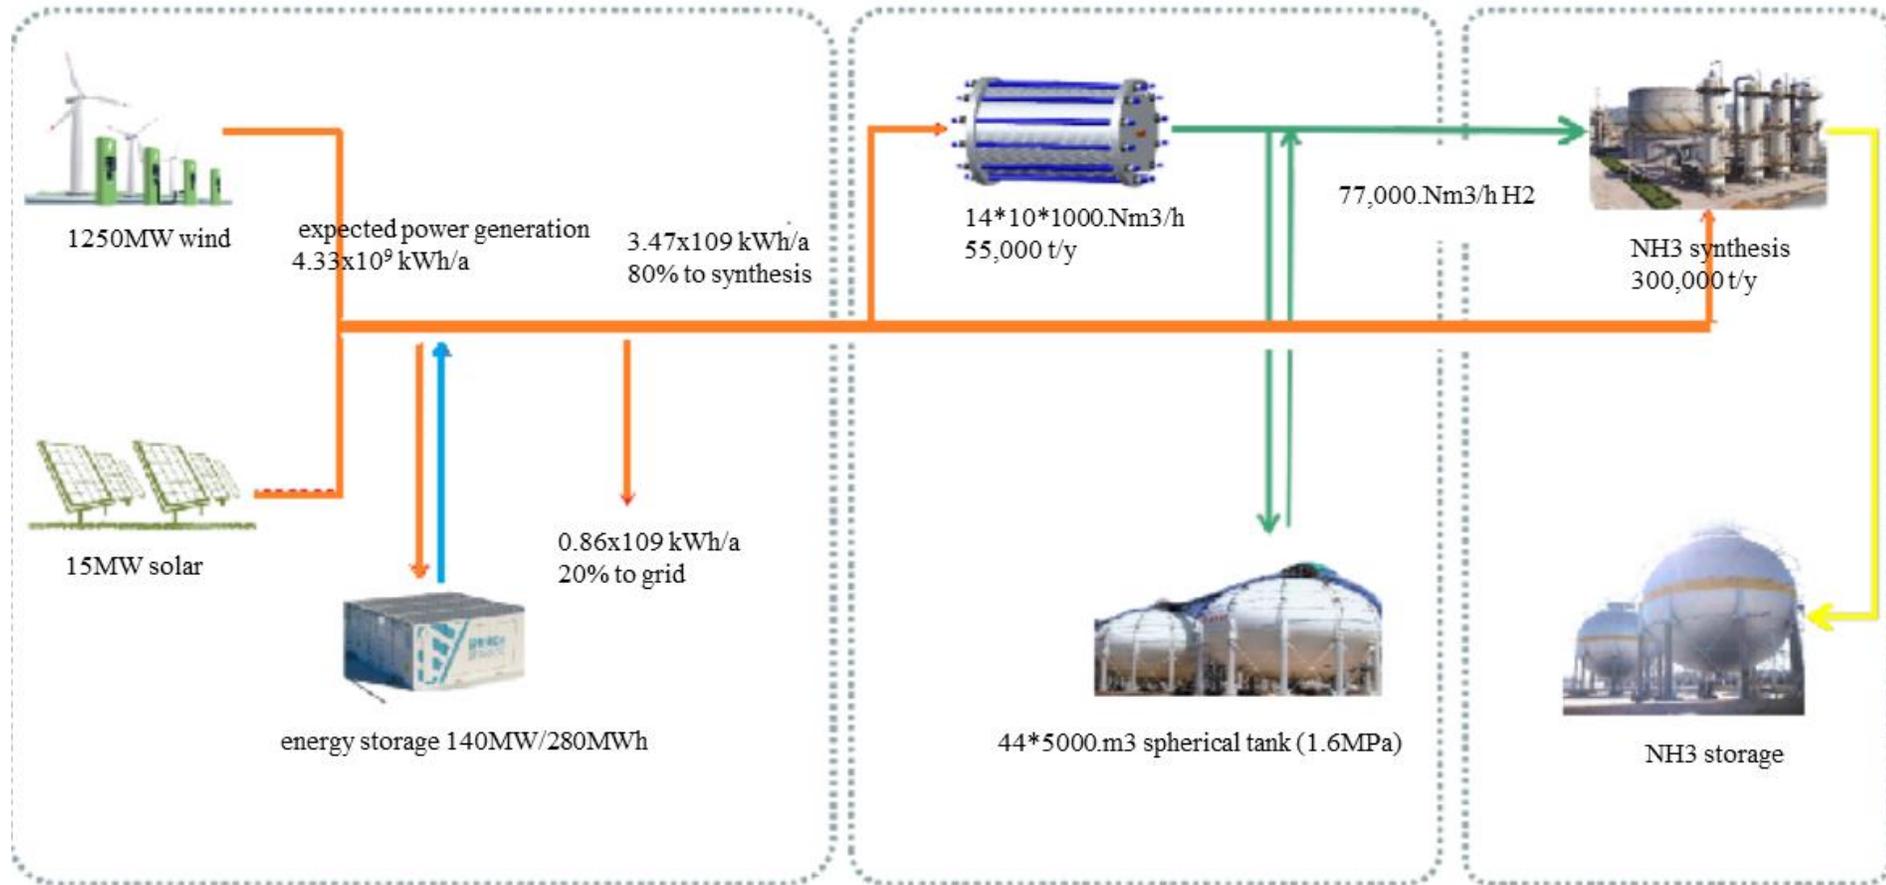

# Process of green NH<sub>3</sub> plant

**Power supply**  
 1250MW wind + 15MW solar  
 energy storage 140MW/280MWh

**H<sub>2</sub> production**  
 140,000 Nm<sup>3</sup>/h  
 H<sub>2</sub> storage 2860,000Nm<sup>3</sup>

**NH<sub>3</sub> synthesis**  
 300,000 t/y

€ 0.02/kWh

H<sub>2</sub>: € 1.95/kWh

NH<sub>3</sub>: € 370/t

# Layout of green methanol industry

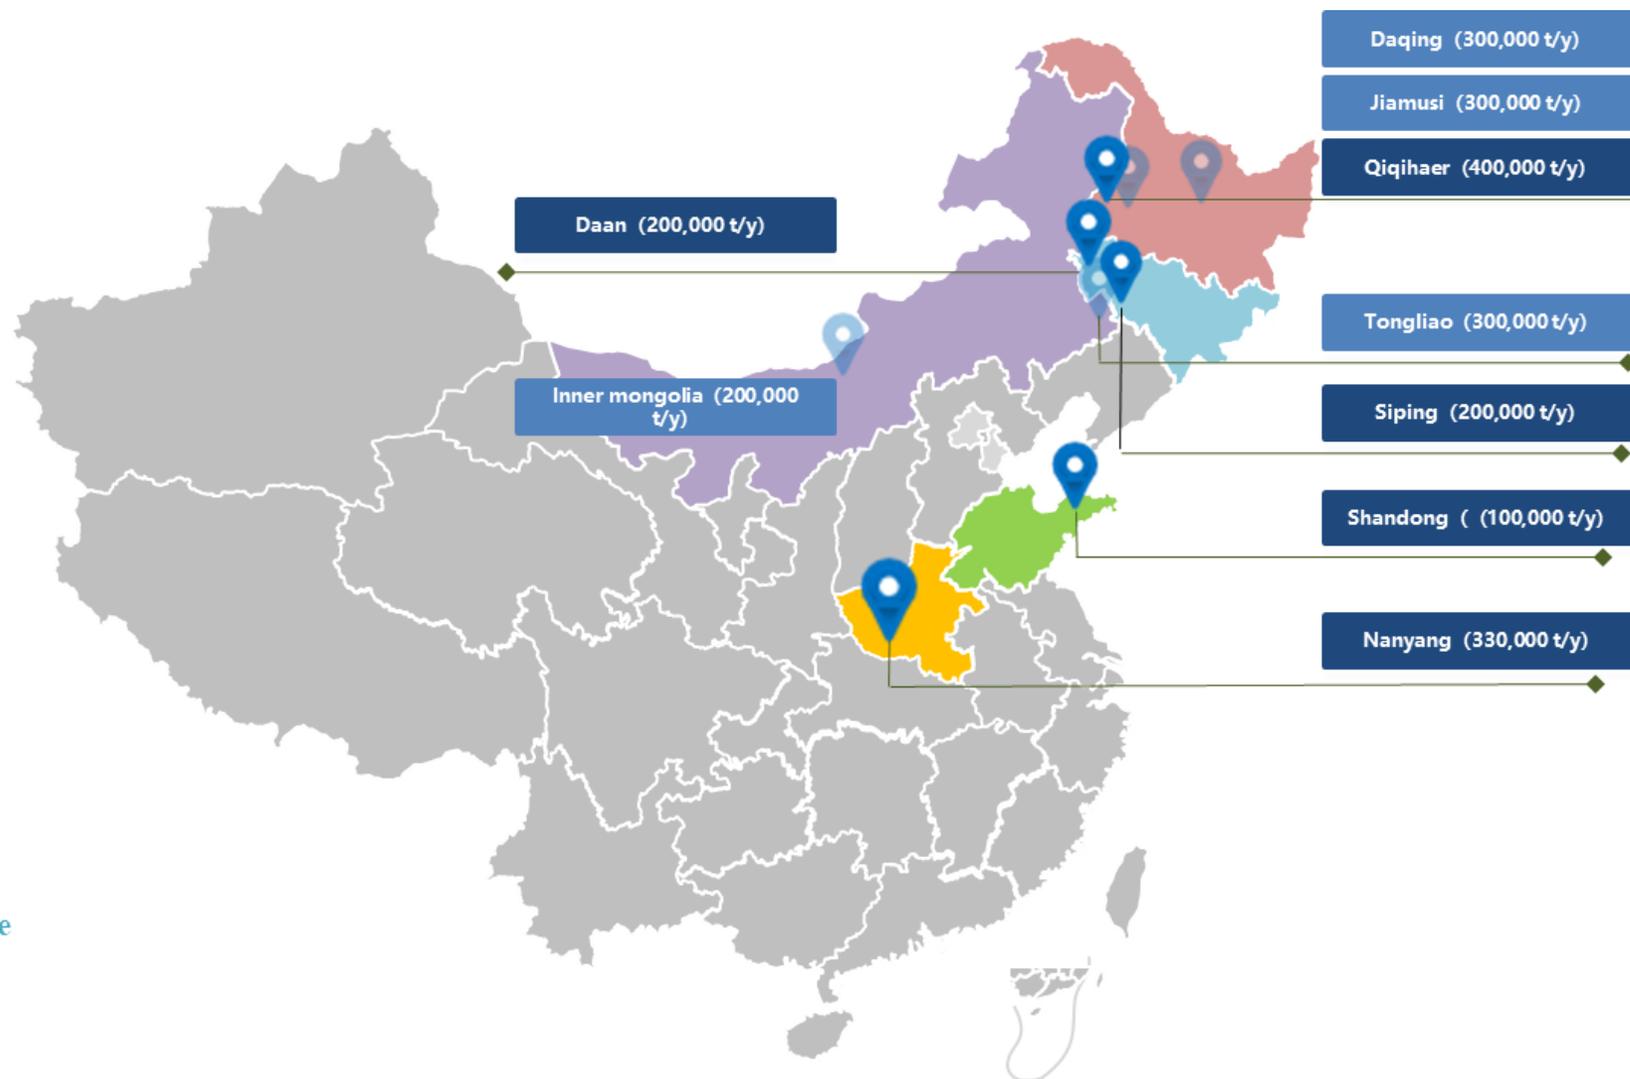

## Green methanol

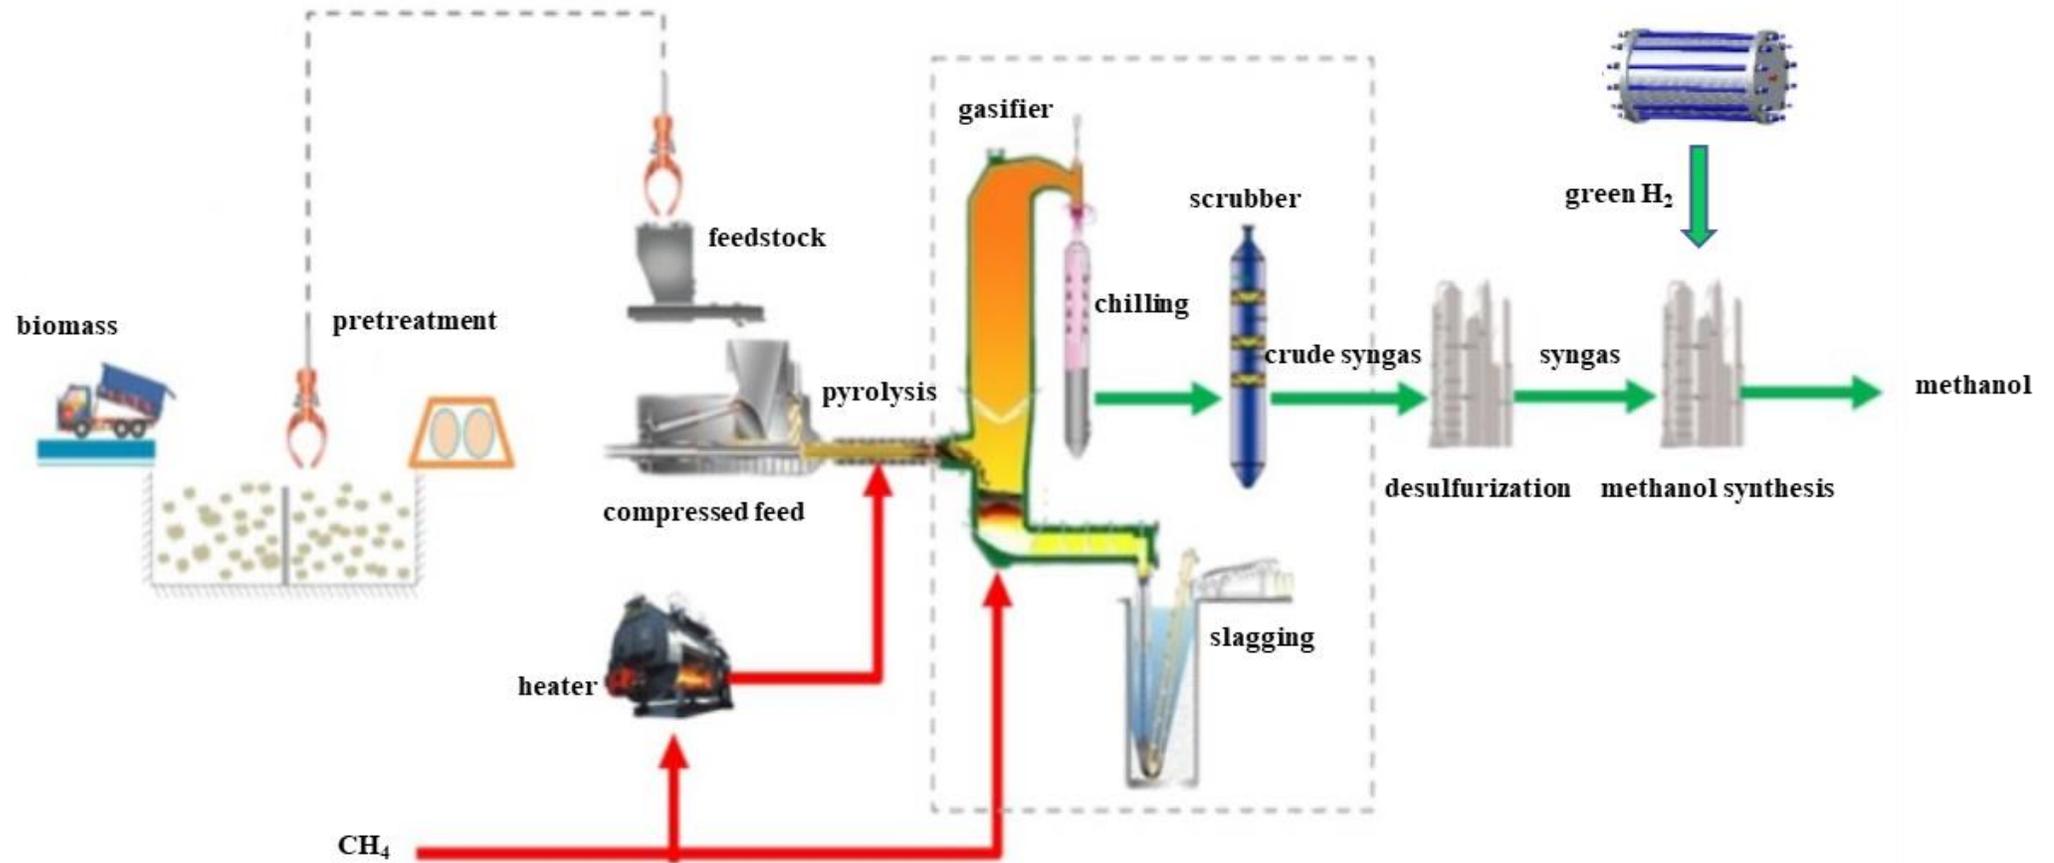

Located in northeast and east of China, with abundant biomass and wind/solar sources, and close to sea port.

 **Quota granted projects**  
(1230,000 t/y, 800,000 t in 2025)

 **Not granted yet, in negotiation stage**  
(1100,000 t/y)

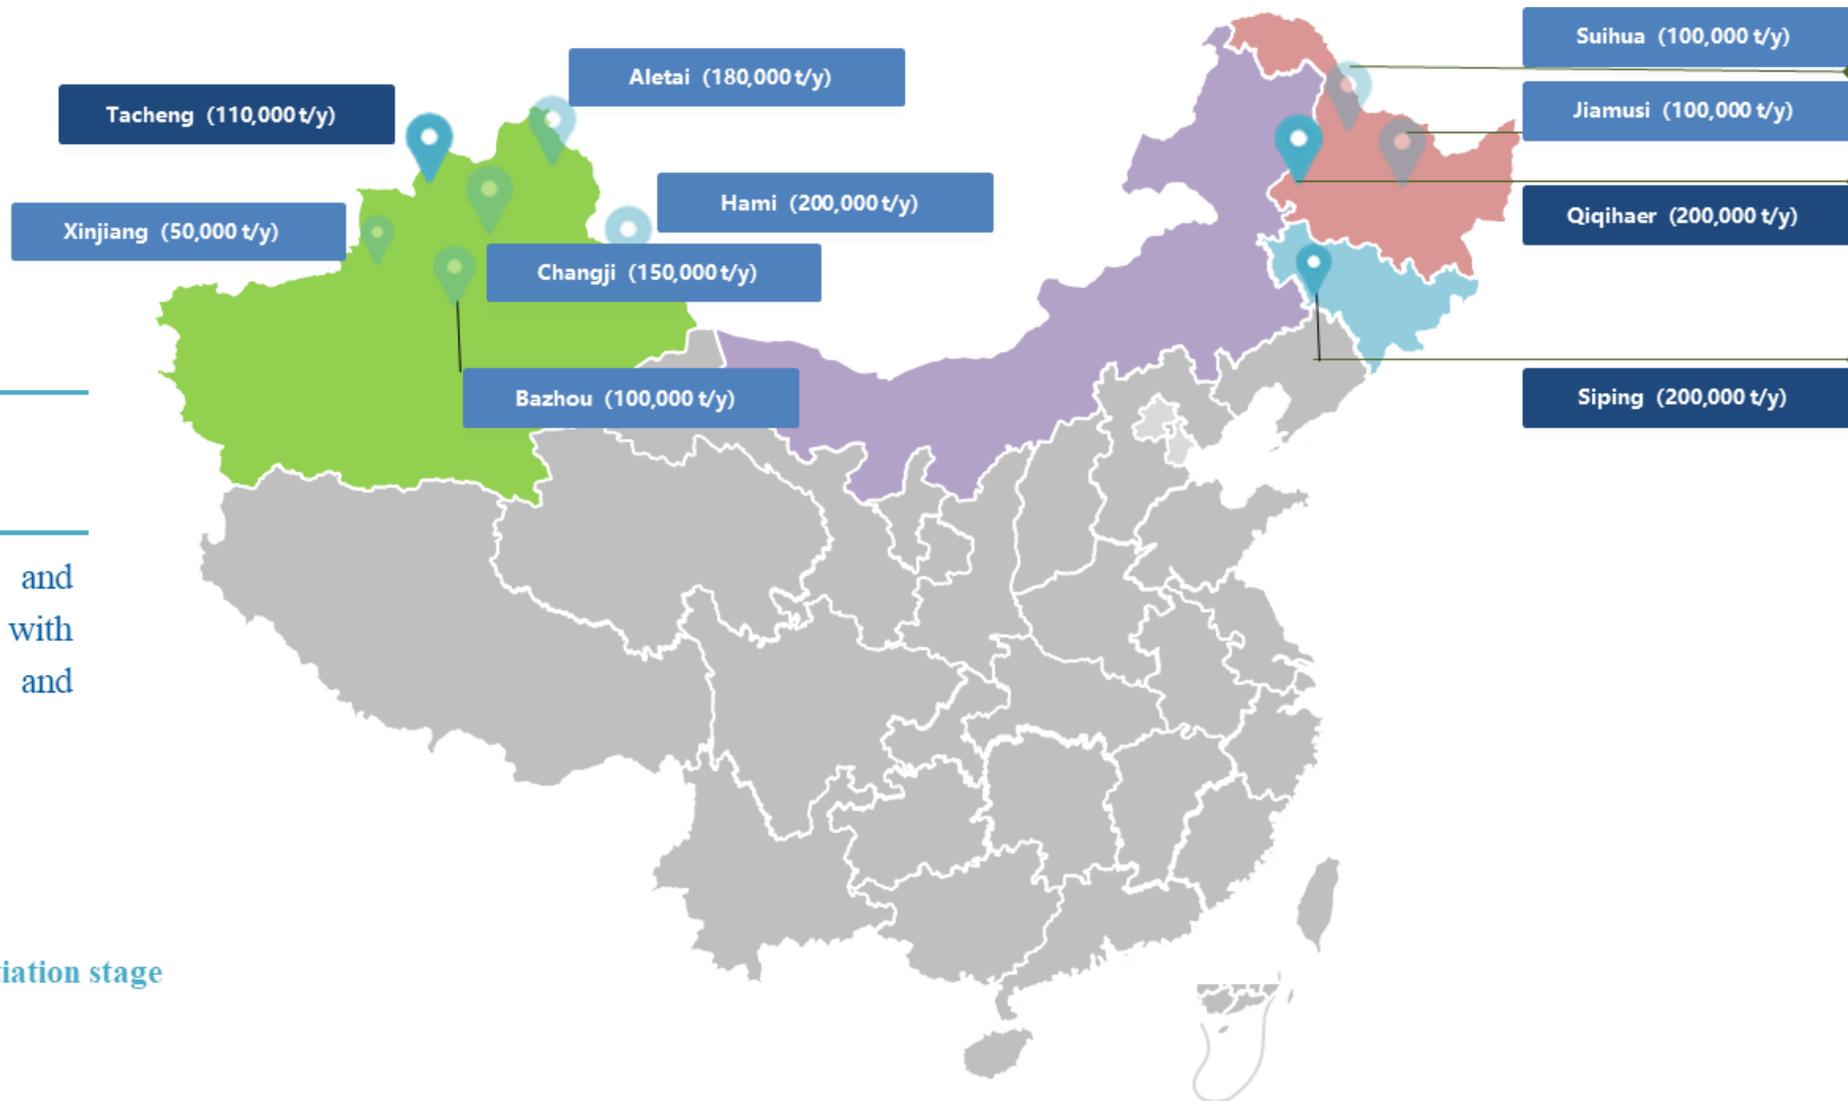

# Process of methanol plant

- 1.3t corn straw + 77 kg H<sub>2</sub> → 1t methanol
- Green methanol: € 420/t

# Layout of SAF industry

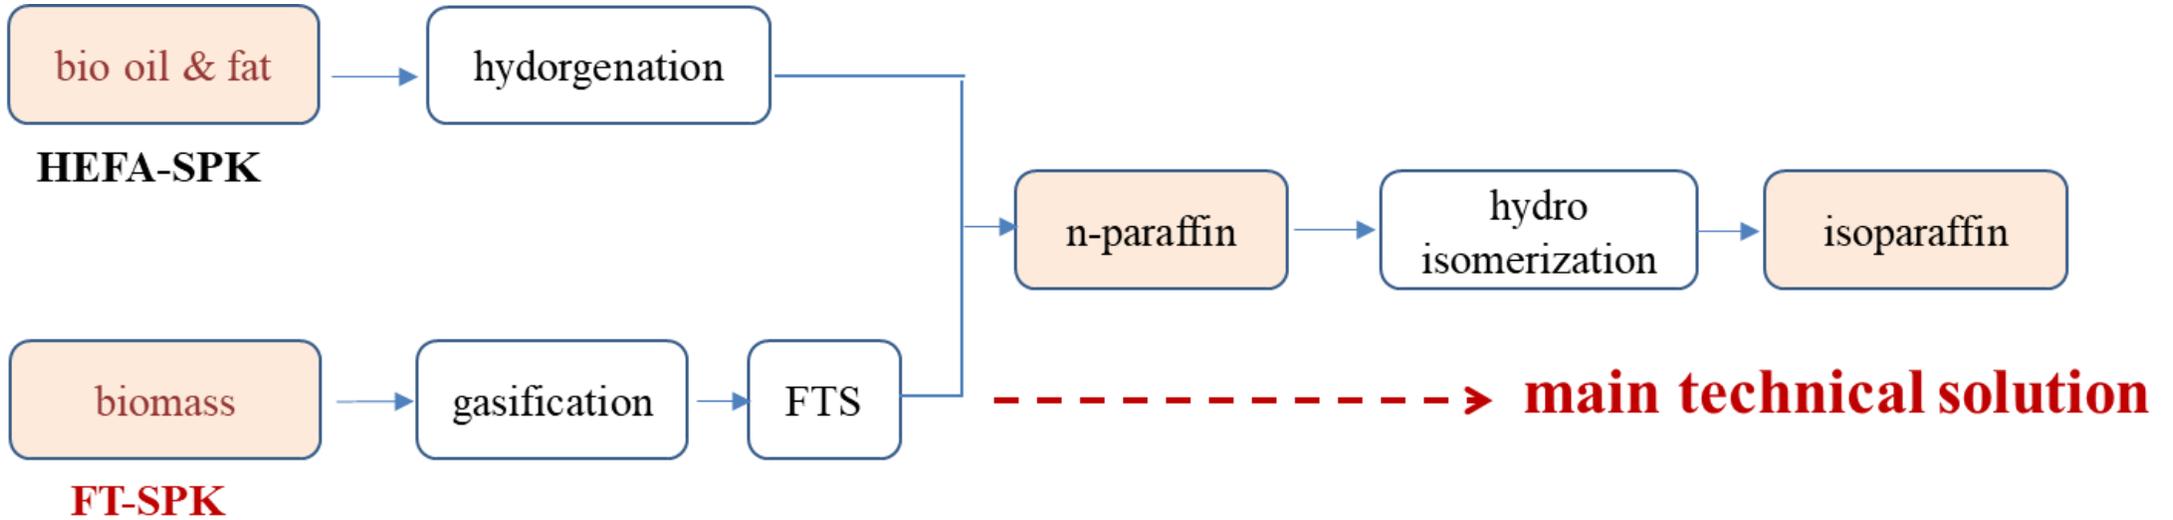

## SAF

Located in northeast and northwest of China, with abundant biomass and wind/solar resources

 Quota granted projects  
(360,000 t/y)

 Not granted yet, in negotiation stage  
(880,000 t/y)

# SAF technical solutions

Product is regulated by American **ASTM D7566**

## Three 10GW industry clusters

Jilin: 10.8GW

Xinjiang: 10.7GW

Inner mongonia: 9.45GW

## Several GW industry bases

Qinghai: 6.98GW

Tibet: 5.35GW

Heilongjiang: 4.6GW

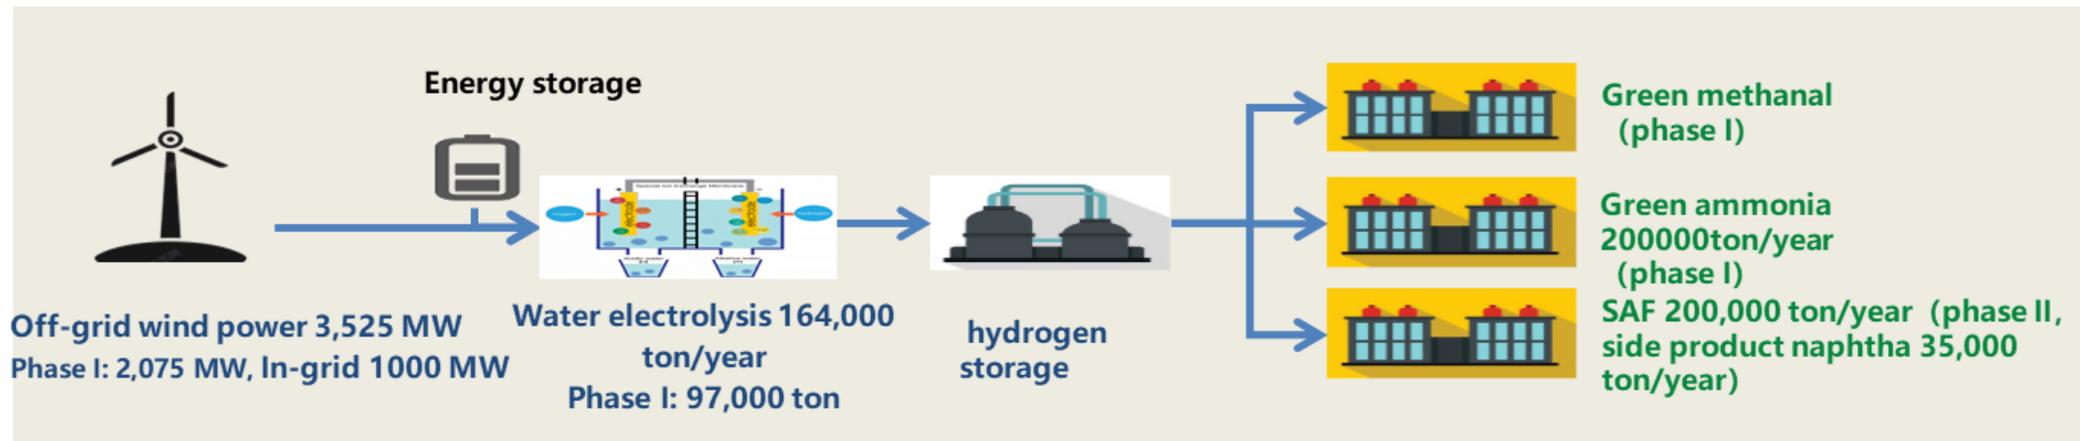

Gansu: 2GW

Sichuan: 1.4GW

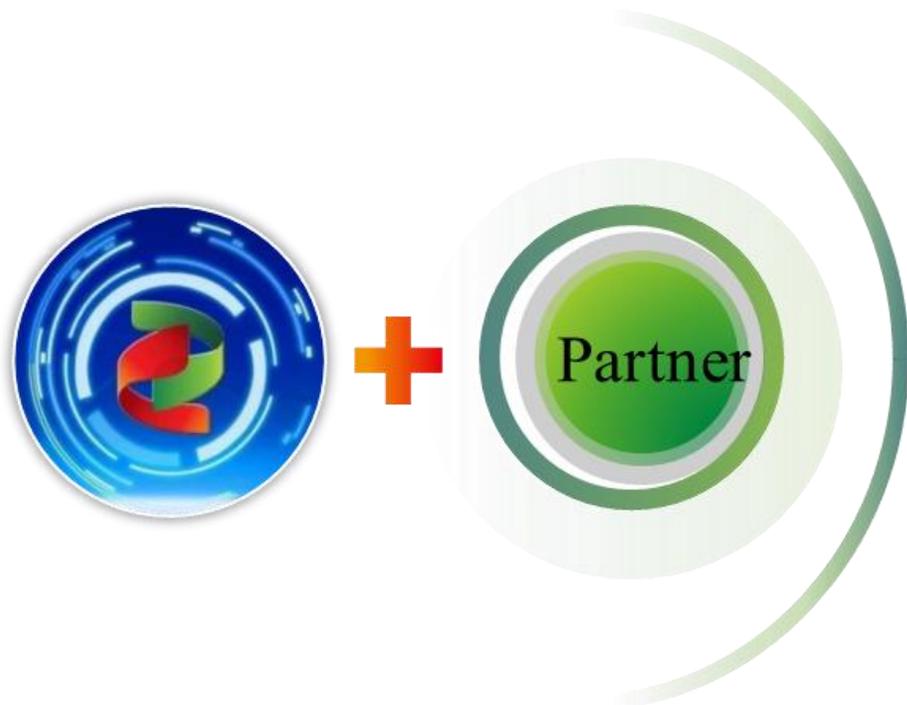

# Comprehensive utilization of green H<sub>2</sub> in northeastern China

- **Overall Plan:** 3,525MW off-grid wind power, 164,000 ton/year hydrogen production facility, 400,000 ton/year green methanol, 200,000 ton/year green ammonia, 200,000 ton/year SAF; 1,000MW wind power connect to the grid. The project is overall planned, and will be conducted in different phases.
- **Phase I:** 2,075MW off-grid wind power, 97,000ton/year hydrogen production facility, 400,000 ton/year green methanol and 200,000 ton/year green ammonia.
- **Phase II:** 1,450 MW off-grid wind power, 67,000 ton/year hydrogen production facility, 2×100,000 ton/year SAF plants.
