

Burundi

Sustainable Development Goal 7.2: Energy Indicators (2016)

Renewable energy (% of TFEC)	89.2	Access to electricity (% of population)	9.3
Energy efficiency (MJ per \$1 of GDP)	8.3	Access to clean cooking (% of population)	<5

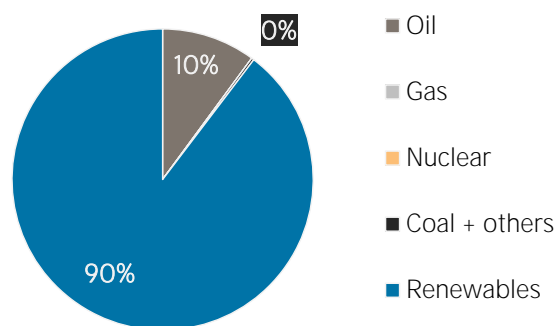

TOTAL PRIMARY ENERGY SUPPLY (TPES)

TPES	2011	2016
Non-renewable (TJ)	6 484	6 547
Renewable (TJ)	87 631	56 679
Total (TJ)	94 115	63 226
Renewable share (%)	93	90

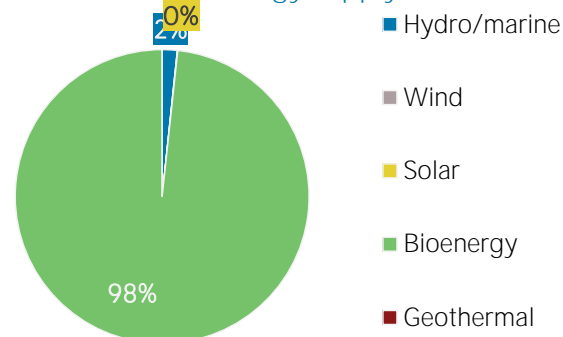

Growth in TPES	2011-16	2015-16
Non-renewable (%)	+1.0	+22.9
Renewable (%)	-35.3	-0.0
Total (%)	-32.8	+2.0

Primary energy trade	2011	2016
Imports (TJ)	6 953	6 805
Exports (TJ)	0	9
Net trade (TJ)	- 6 953	- 6 796
Imports (% of supply)	7	11
Exports (% of production)	0	0
Energy self-sufficiency (%)	93	89
Net trade (USD million)	- 342	- 108
Net trade (% of GDP)	-15.3	-3.6

Total primary energy supply in 2016

Renewable energy supply in 2016

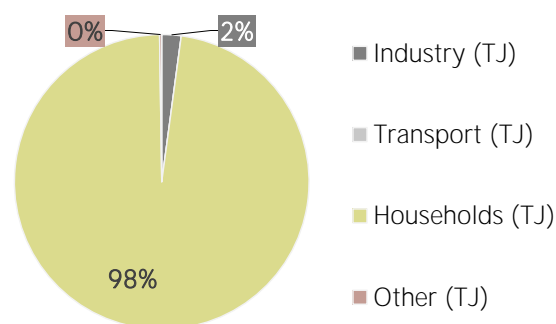

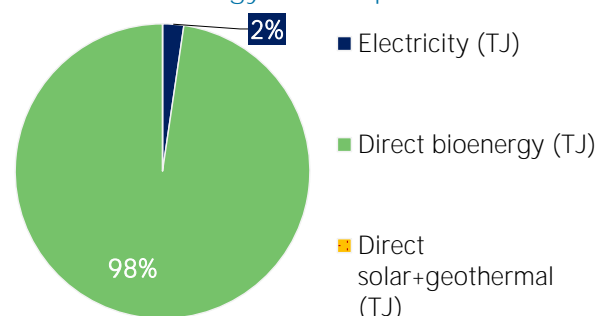

RENEWABLE ENERGY CONSUMPTION

Consumption by source	2011	2016
Electricity (TJ)	1 126	1 156
Direct bioenergy (TJ)	84 844	48 705
Direct solar+geothermal (TJ)	0	0
Total (TJ)	85 970	49 861
Electricity share (%)	1	2

Consumption growth	2011-16	2015-16
Renewable electricity (%)	+2.7	-2.3
Other renewables (%)	-42.6	+0.0
Total (%)	-42.0	-0.0

Consumption by sector	2011	2016
Industry (TJ)	979	1 058
Transport (TJ)	0	0
Households (TJ)	84 892	48 685
Other (TJ)	98	118
Renewable share of TFEC	93.8	89.2

Renewable energy consumption in 2016

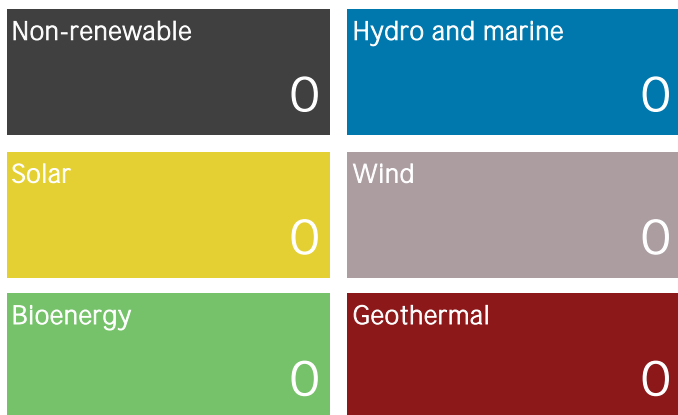

ELECTRICITY CAPACITY AND GENERATION

Capacity in 2018	MW	%
Non-renewable	51	47
Renewable	57	53
Hydro/marine	48	45
Solar	5	5
Wind	0	0
Bioenergy	4	4
Geothermal	0	0
Total	108	100

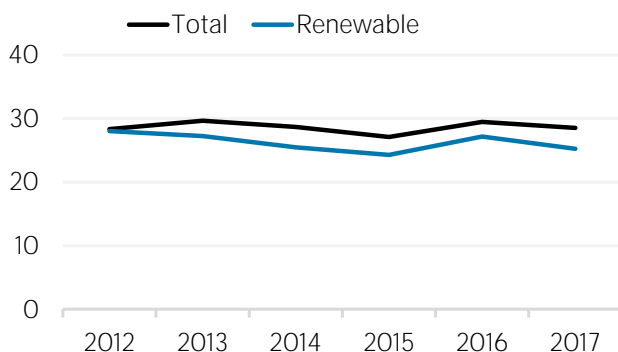

Capacity change (%)	2013-18	2017-18
Non-renewable	+ 146	0.0
Renewable	+ 0	0.0
Hydro/marine	- 5	0.0
Solar	+ 96	0.0
Wind	0	0.0
Bioenergy	0	0.0
Geothermal	0	0.0
Total	+ 39	0.0

Net capacity change in 2018 (MW)

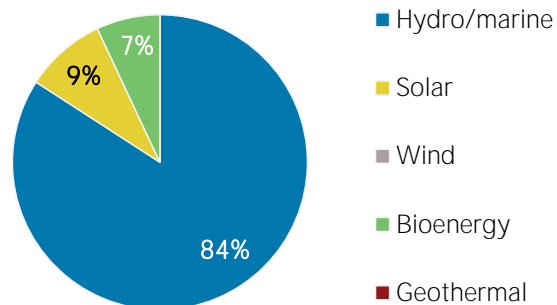

Generation in 2017	GWh	%
Non-renewable	36	12
Renewable	273	88
Hydro and marine	259	84
Solar	8	3
Wind	0	0
Bioenergy	7	2
Geothermal	0	0
Total	309	100

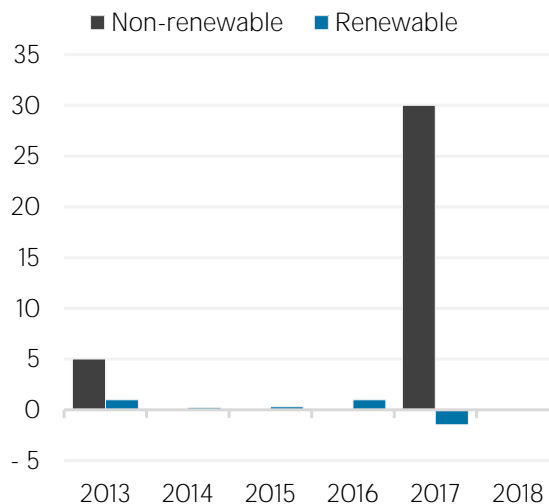

Per capita electricity generation (kWh)

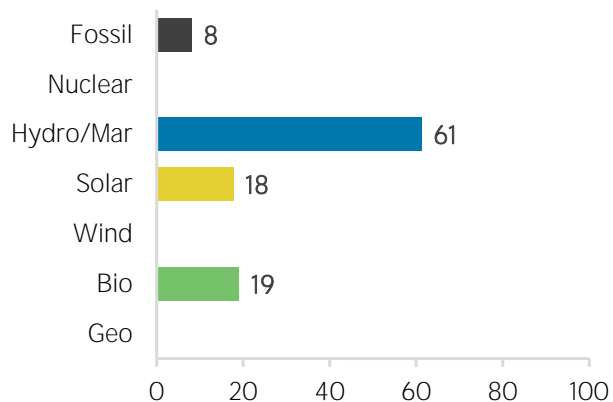

Renewable capacity in 2018

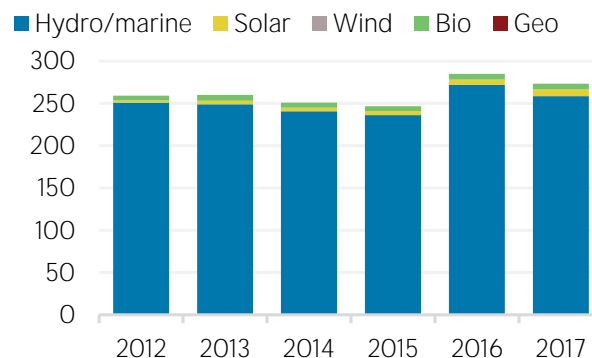

Net capacity change (MW)

Capacity utilisation in 2017 (%)

Renewable generation (GWh)

Most immediate clean energy targets & NDCs

	year	target	unit

- Energy efficiency

Conditional Unconditional unit

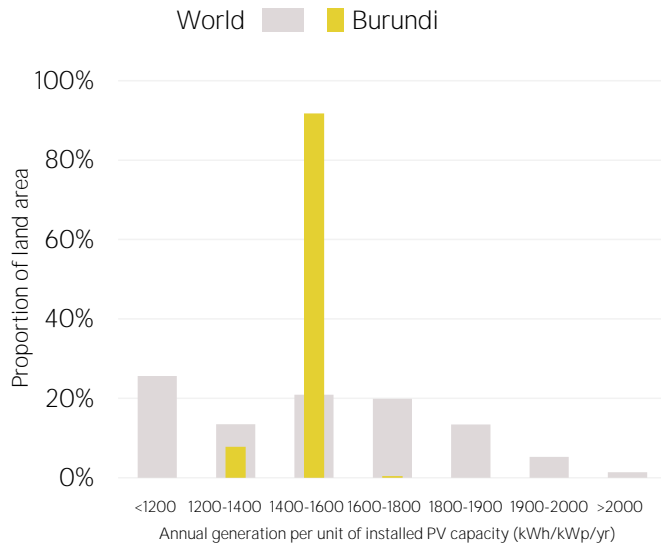

ENERGY AND EMISSIONS

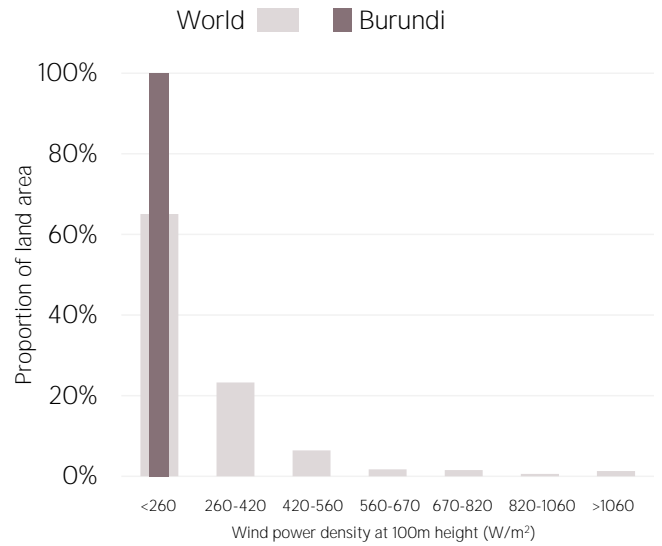

Avoided emissions based on fossil fuel mix used for power

Reduction is RE Avoided divided by sum of avoided and emitted

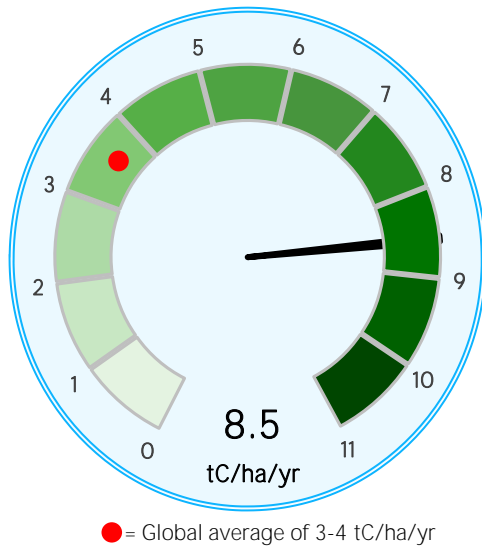

Distribution of solar potential

Distribution of wind potential

Biomass potential: net primary production

Indicators of renewable resource potential

Solar PV: Solar resource potential has been divided into seven classes, each representing a range of annual PV output per unit of capacity (kWh/kWp/yr). The bar chart shows the proportion of a country's land area in each of these classes and the global distribution of land area across the classes (for comparison).

Onshore wind: Potential wind power density (W/m^2) is shown in the seven classes used by NREL, measured at a height of 100m. The bar chart shows the distribution of the country's land area in each of these classes compared to the global distribution of wind resources. Areas in the third class or above are considered to be a good wind resource.

Biomass: Net primary production (NPP) is the amount of carbon fixed by plants and accumulated as biomass each year. It is a basic measure of biomass productivity. The chart shows the average NPP in the country (tC/ha/yr), compared to the global average NPP of 3-4 tonnes of carbon per year.

Sources: IRENA statistics, plus data from the following sources: UN SDG Indicators Database (original sources: WHO; World Bank; IEA; IRENA; and UNSD); UNSD Energy Balances; UN COMTRADE; World Bank World Development Indicators; EDGAR; REN21 Global Status Report; IEA-IRENA Joint Policies and Measures Database; IRENA Global Atlas; and World Bank Global Solar Atlas and Global Wind Atlas.

Additional notes: Energy self-sufficiency has been defined as total primary energy production divided by total primary energy supply. The value of energy trade has been defined as including all commodities in Chapter 27 of the Harmonised System (HS). Capacity utilisation has been calculated as annual generation divided by capacity x 8,760. Avoided emissions from renewable power have been calculated as renewable generation divided by fossil fuel generation multiplied by reported emissions from the power sector. This assumes that, if renewable power did not exist, fossil fuels would be used in its place to generate the same amount of power and using the same mix of fossil fuels. In countries and years where no fossil fuel generation occurs, an average fossil fuel emission factor has been used to calculate the avoided emissions.

This note has been produced to provide policy makers with a brief overview of developments in renewable energy in a country. The IRENA statistics team would welcome comments and feedback on its structure and content, which can be sent to statistics@irena.org.
