

Brunei Darussalam

Sustainable Development Goal 7.2: Energy Indicators (2016)

Renewable energy (% of TFEC)	0.0	Access to electricity (% of population)	100.0
Energy efficiency (MJ per \$1 of GDP)	4.1	Access to clean cooking (% of population)	>95

TOTAL PRIMARY ENERGY SUPPLY (TPES)

TPES	2011	2016
Non-renewable (TJ)	161 997	123 723
Renewable (TJ)	121	119
Total (TJ)	162 118	123 842
Renewable share (%)	0	0

Growth in TPES	2011-16	2015-16
Non-renewable (%)	-23.6	+8.8
Renewable (%)	-1.8	-4.8
Total (%)	-23.6	+8.8

Primary energy trade	2011	2016
Imports (TJ)	11 365	16 434
Exports (TJ)	619 386	523 148
Net trade (TJ)	608 021	506 714
Imports (% of supply)	7	13
Exports (% of production)	79	83
Energy self-sufficiency (%)	481	511
Net trade (USD million)	+ 11 593	+ 4 053
Net trade (% of GDP)	+62.6	+35.6

Total primary energy supply in 2016

Renewable energy supply in 2016

RENEWABLE ENERGY CONSUMPTION

Consumption by source	2011	2016
Electricity (TJ)	5	3
Direct bioenergy (TJ)	108	107
Direct solar+geothermal (TJ)	0	0
Total (TJ)	113	110
Electricity share (%)	4	3

Consumption growth	2011-16	2015-16
Renewable electricity (%)	-41.2	+0.3
Other renewables (%)	-0.9	-5.3
Total (%)	-2.7	-5.2

Consumption by sector	2011	2016
Industry (TJ)	0	0
Transport (TJ)	0	0
Households (TJ)	110	108
Other (TJ)	3	2
Renewable share of TFEC	0.0	.0

Renewable energy consumption in 2016

ELECTRICITY CAPACITY AND GENERATION

Capacity in 2018	MW	%
Non-renewable	1 006	100
Renewable	1	0
Hydro/marine	0	0
Solar	1	0
Wind	0	0
Bioenergy	0	0
Geothermal	0	0
Total	1 007	100

Capacity change (%)	2013-18	2017-18
Non-renewable	+ 10	+ 1.3
Renewable	0	0.0
Hydro/marine	0	0.0
Solar	0	0.0
Wind	0	0.0
Bioenergy	0	0.0
Geothermal	0	0.0
Total	+ 10	+ 1.3

Net capacity change in 2018 (MW)

Generation in 2017	GWh	%
Non-renewable	4 157	100
Renewable	1	0
Hydro and marine	0	0
Solar	1	0
Wind	0	0
Bioenergy	0	0
Geothermal	0	0
Total	4 158	100

Per capita electricity generation (kWh)

Renewable capacity in 2018

Net capacity change (MW)

Capacity utilisation in 2017 (%)

Renewable generation (GWh)

Most immediate clean energy targets & NDCs

	year	target	unit

- transport			
- heating/cooling			
- Energy efficiency			

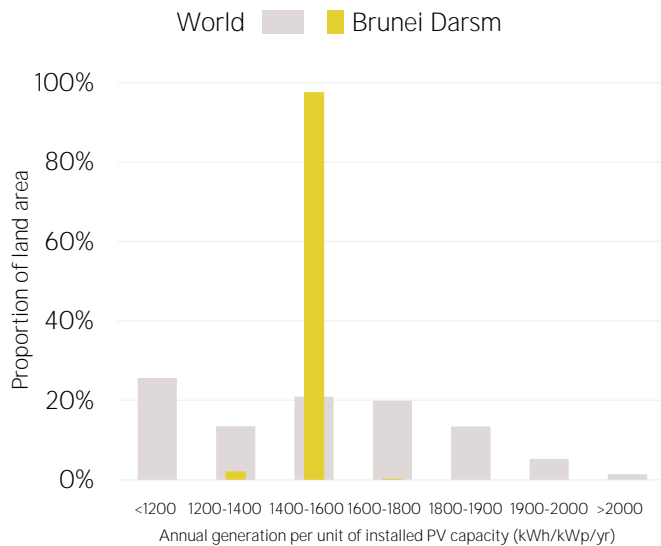

ENERGY AND EMISSIONS

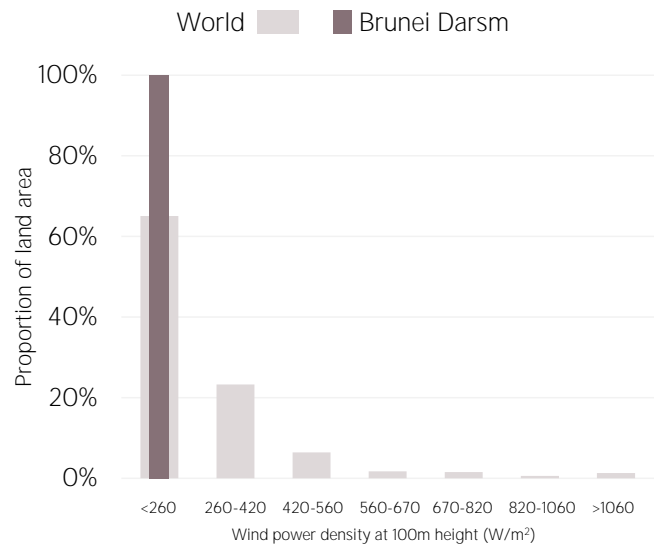

Avoided emissions based on fossil fuel mix used for power

Reduction is RE Avoided divided by sum of avoided and emitted

Distribution of solar potential

Distribution of wind potential

Biomass potential: net primary production

Indicators of renewable resource potential

Solar PV: Solar resource potential has been divided into seven classes, each representing a range of annual PV output per unit of capacity (kWh/kWp/yr). The bar chart shows the proportion of a country's land area in each of these classes and the global distribution of land area across the classes (for comparison).

Onshore wind: Potential wind power density (W/m^2) is shown in the seven classes used by NREL, measured at a height of 100m. The bar chart shows the distribution of the country's land area in each of these classes compared to the global distribution of wind resources. Areas in the third class or above are considered to be a good wind resource.

Biomass: Net primary production (NPP) is the amount of carbon fixed by plants and accumulated as biomass each year. It is a basic measure of biomass productivity. The chart shows the average NPP in the country (tC/ha/yr), compared to the global average NPP of 3-4 tonnes of carbon per year.

Sources: IRENA statistics, plus data from the following sources: UN SDG Indicators Database (original sources: WHO; World Bank; IEA; IRENA; and UNSD); UNSD Energy Balances; UN COMTRADE; World Bank World Development Indicators; EDGAR; REN21 Global Status Report; IEA-IRENA Joint Policies and Measures Database; IRENA Global Atlas; and World Bank Global Solar Atlas and Global Wind Atlas.

Additional notes: Energy self-sufficiency has been defined as total primary energy production divided by total primary energy supply. The value of energy trade has been defined as including all commodities in Chapter 27 of the Harmonised System (HS). Capacity utilisation has been calculated as annual generation divided by capacity x 8,760. Avoided emissions from renewable power have been calculated as renewable generation divided by fossil fuel generation multiplied by reported emissions from the power sector. This assumes that, if renewable power did not exist, fossil fuels would be used in its place to generate the same amount of power and using the same mix of fossil fuels. In countries and years where no fossil fuel generation occurs, an average fossil fuel emission factor has been used to calculate the avoided emissions.

This note has been produced to provide policy makers with a brief overview of developments in renewable energy in a country. The IRENA statistics team would welcome comments and feedback on its structure and content, which can be sent to statistics@irena.org.
