Japan

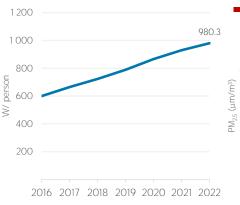

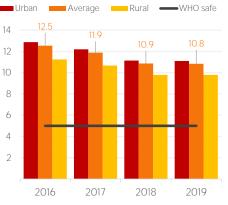

7.b.1 Per capita renewable capacity

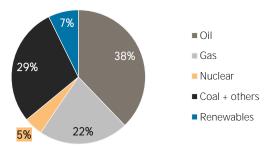

TOTAL ENERGY SUPPLY (TES)

Total Energy Supply (TES)	2016	2021
Non-renewable (TJ)	17 016 360	15 559 135
Renewable (TJ)	951 110	1 222 468
Total (TJ)	17 967 470	16 781 603
Renewable share (%)	5	7
Growth in TES	2016-21	2020-21
Non-renewable (%)	-8.6	+3.6

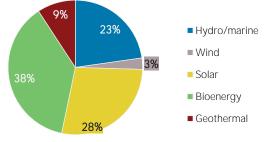

Growth in TES	2016-21	2020-21
Non-renewable (%)	-8.6	+3.6
Renewable (%)	+28.5	+6.5
Total (%)	-6.6	+3.8

Primary energy trade	2016	2021
Imports (TJ)	17 662 160	15 473 584
Exports (TJ)	797 000	610 169
Net trade (TJ)	-16 865 160	-14 863 415
Imports (% of supply)	98	92
Exports (% of production)	54	27
Energy self-sufficiency (%)	8	13

LATEST POLICIES, PROGRAMMES AND LEGISLATION

1 Amendment to the Energy Conservation Act	2023
2 CCS Long-Term Roadmap	2023
3 Coalition for LNG Emission Abatement towards Net-zero (CLEAN)	2023
4 Policy on initiatives for ensuring stable supply of critical minerals	2023
5 2022 Comprehensive emergency measures to address soaring crude oil and commodity prices	2022

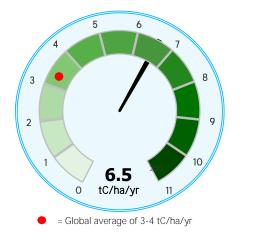

RENEWABLE RESOURCE POTENTIAL

Annual generation per unit of installed PV capacity (MWh/kWp)

Biomass potential: net primary production

Indicators of renewable resource potential

Solar PV: Solar resource potential has been divided into seven classes, each representing a range of annual PV output per unit of capacity (kWh/kWp/yr). The bar chart shows the proportion of a country's land area in each of these classes and the global distribution of land area across the classes (for comparison).

Onshore wind: Potential wind power density (W/m²) is shown in the seven classes used by NREL, measured at a height of 100m. The bar chart shows the distribution of the country's land area in each of these classes compared to the global distribution of wind resources. Areas in the third class or above are considered to be a good wind resource.

Blomass: Net primary production (NPP) is the amount of carbon fixed by plants and accumulated as biomass each year. It is a basic measure of biomass productivity. The chart shows the average NPP in the country (tC/ha/yr), compared to the global average NPP of 3-4 tonnes of carbon

Sources: IRENA statistics, plus data from the following sources: UN SDG Database (original sources: WHO; World Bank; IEA; IRENA; and UNSD); UN World Population Prospects: UNSD Energy Balances; UN COMTRADE; World Bank World Development Indicators; EDGAR; REN21 Global Status Report; IEA-IRENA Joint Policies and Measures Database; IRENA Global Atlas; and World Bank Global Solar Atlas and Global Wind Atlas.

Additional notes: Capacity per capita and public investments SDGs only apply to developing areas. Energy self-sufficiency has been defined as total primary energy production divided by total primary energy supply. Energy trade includes all commodities in Chapter 27 of the Harmonised System (H5). Capacity utilisation is calculated as annual generation divided by year-end capacity x 8.760h/year. Avoided emissions from renewable power is calculated as renewable generation divided by fossil fuel generation multiplied by reported emissions from the power sector. This assumes that, if renewable power did not exist, fossil fuels would be used in its place to generate the same amount of power and using the same mix of fossil fuels. In countries and years where no fossil fuel generation occurs, an average fossil fuel emission factor has been used to calculate the avoided emissions.

These profiles have been produced to provide an overview of developments in renewable energy in different countries and areas. The IRENA statistics team would welcome comments and feedback on its structure and content, which can be sent to statistics@irena.org.
