

Guatemala

Sustainable Development Goal 7.2: Energy Indicators (2016)

Renewable energy (% of TFEC)	63.1	Access to electricity (% of population)	91.9
Energy efficiency (MJ per \$1 of GDP)	4.8	Access to clean cooking (% of population)	43

TOTAL PRIMARY ENERGY SUPPLY (TPES)

TPES	2011	2016
Non-renewable (TJ)	138 468	197 383
Renewable (TJ)	278 681	339 250
Total (TJ)	417 150	536 633
Renewable share (%)	67	63

Growth in TPES	2011-16	2015-16
Non-renewable (%)	+42.5	+5.9
Renewable (%)	+21.7	+25.9
Total (%)	+28.6	+17.8

Primary energy trade	2011	2016
Imports (TJ)	160 469	243 622
Exports (TJ)	29 504	38 161
Net trade (TJ)	- 130 965	- 205 461
Imports (% of supply)	38	45
Exports (% of production)	10	11
Energy self-sufficiency (%)	73	67
Net trade (USD million)	- 2 809	- 1 970
Net trade (% of GDP)	-5.9	-2.9

Total primary energy supply in 2016

Renewable energy supply in 2016

RENEWABLE ENERGY CONSUMPTION

Consumption by source	2011	2016
Electricity (TJ)	18 540	24 024
Direct bioenergy (TJ)	179 306	222 007
Direct solar+geothermal (TJ)	0	0
Total (TJ)	197 846	246 031
Electricity share (%)	9	10

Consumption growth	2011-16	2015-16
Renewable electricity (%)	+29.6	+24.1
Other renewables (%)	+23.8	+19.1
Total (%)	+24.4	+19.5

Consumption by sector	2011	2016
Industry (TJ)	7 529	8 780
Transport (TJ)	0	0
Households (TJ)	179 496	222 812
Other (TJ)	10 822	14 440
Renewable share of TFEC	67.4	63.1

Renewable energy consumption in 2016

ELECTRICITY CAPACITY AND GENERATION

Capacity in 2018	MW	%
Non-renewable	1 245	29
Renewable	2 982	71
Hydro/marine	1 621	38
Solar	101	2
Wind	107	3
Bioenergy	1 103	26
Geothermal	49	1
Total	4 227	100

Capacity change (%)	2013-18	2017-18
Non-renewable	- 6	- 6.2
Renewable	+ 81	+ 8.3
Hydro/marine	+ 63	+ 12.8
Solar	+ 3 838	+ 1.5
Wind	0	+ 41.5
Bioenergy	+ 84	+ 1.1
Geothermal	0	0.0
Total	+ 42	+ 3.6

Net capacity change in 2018 (MW)

Generation in 2017	GWh	%
Non-renewable	3 460	30
Renewable	8 041	70
Hydro and marine	5 765	50
Solar	210	2
Wind	218	2
Bioenergy	1 595	14
Geothermal	253	2
Total	11 501	100

Per capita electricity generation (kWh)

Renewable capacity in 2018

Net capacity change (MW)

Capacity utilisation in 2017 (%)

Renewable generation (GWh)

Most immediate clean energy targets & NDCs

ENERGY AND EMISSIONS

Avoided emissions based on fossil fuel mix used for power

Reduction is RE Avoided divided by sum of avoided and emitted

Distribution of solar potential

Distribution of wind potential

Biomass potential: net primary production

Indicators of renewable resource potential

Solar PV: Solar resource potential has been divided into seven classes, each representing a range of annual PV output per unit of capacity (kWh/kWp/yr). The bar chart shows the proportion of a country's land area in each of these classes and the global distribution of land area across the classes (for comparison).

Onshore wind: Potential wind power density (W/m^2) is shown in the seven classes used by NREL, measured at a height of 100m. The bar chart shows the distribution of the country's land area in each of these classes compared to the global distribution of wind resources. Areas in the third class or above are considered to be a good wind resource.

Biomass: Net primary production (NPP) is the amount of carbon fixed by plants and accumulated as biomass each year. It is a basic measure of biomass productivity. The chart shows the average NPP in the country (tC/ha/yr), compared to the global average NPP of 3-4 tonnes of carbon per year.

Sources: IRENA statistics, plus data from the following sources: UN SDG Indicators Database (original sources: WHO; World Bank; IEA; IRENA; and UNSD); UNSD Energy Balances; UN COMTRADE; World Bank World Development Indicators; EDGAR; REN21 Global Status Report; IEA-IRENA Joint Policies and Measures Database; IRENA Global Atlas; and World Bank Global Solar Atlas and Global Wind Atlas.

Additional notes: Energy self-sufficiency has been defined as total primary energy production divided by total primary energy supply. The value of energy trade has been defined as including all commodities in Chapter 27 of the Harmonised System (HS). Capacity utilisation has been calculated as annual generation divided by capacity x 8,760. Avoided emissions from renewable power have been calculated as renewable generation divided by fossil fuel generation multiplied by reported emissions from the power sector. This assumes that, if renewable power did not exist, fossil fuels would be used in its place to generate the same amount of power and using the same mix of fossil fuels. In countries and years where no fossil fuel generation occurs, an average fossil fuel emission factor has been used to calculate the avoided emissions.

This note has been produced to provide policy makers with a brief overview of developments in renewable energy in a country. The IRENA statistics team would welcome comments and feedback on its structure and content, which can be sent to statistics@irena.org.
