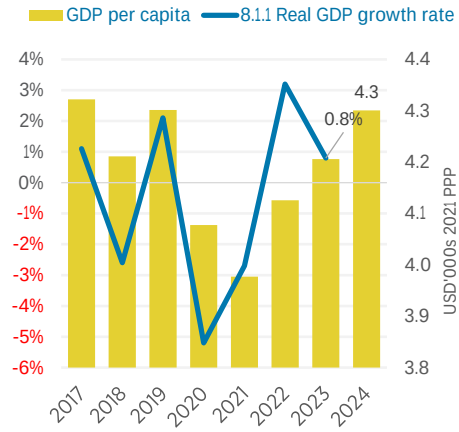
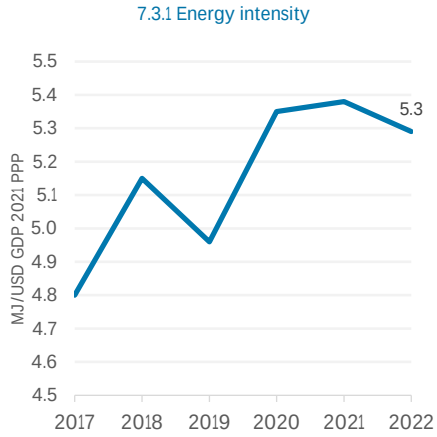
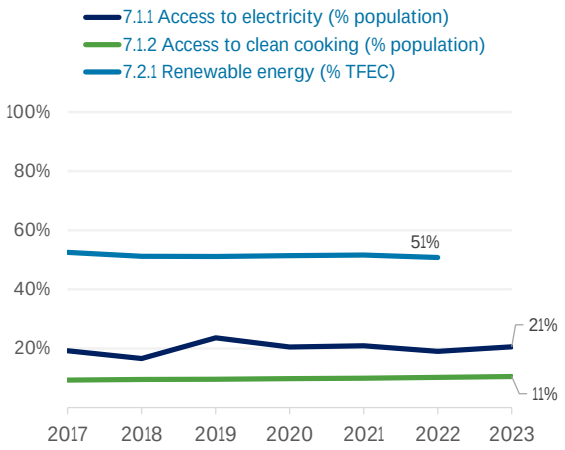
ENERGY PROFILE

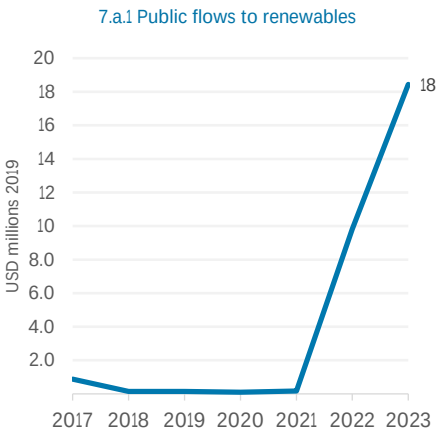
Papua New Guinea

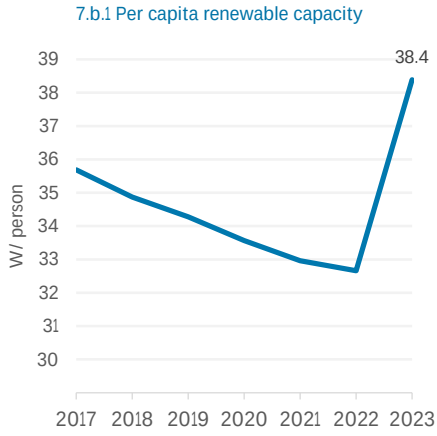
COUNTRY INDICATORS AND SDGS

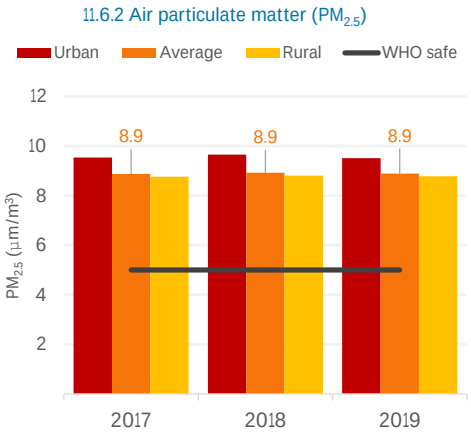












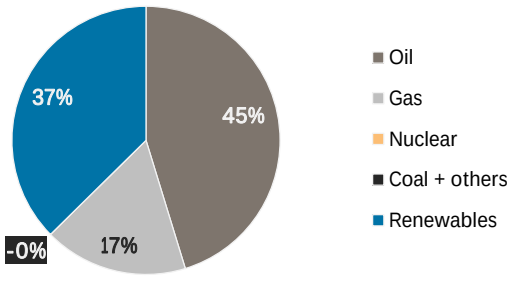
TOTAL ENERGY SUPPLY (TES)

Total Energy Supply (TES)	2017	2022
Non-renewable (TJ)	90 899	120 358
Renewable (TJ)	76 228	71 832
Total (TJ)	167 127	192 190
Renewable share (%)	46	37

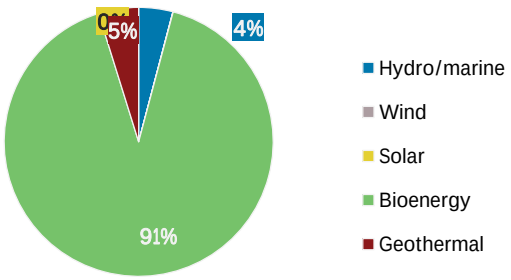
Growth in TES	2017-22	2021-22
Non-renewable (%)	+32.4	+2.4
Renewable (%)	-5.8	-6.4
Total (%)	+15.0	-1.1

Primary energy trade	2017	2022
Imports (TJ)	99 898	107 759
Exports (TJ)	159 535	528 908
Net trade (TJ)	59 637	421 149
Imports (% of supply)	60	56
Exports (% of production)	68	86
Energy self-sufficiency (%)	140	321

Total energy supply in 2022

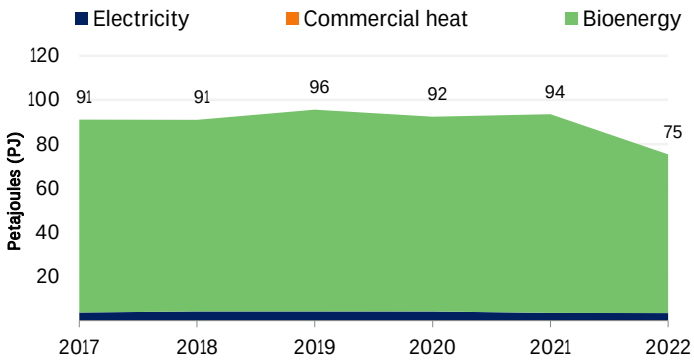


Renewable energy supply in 2022



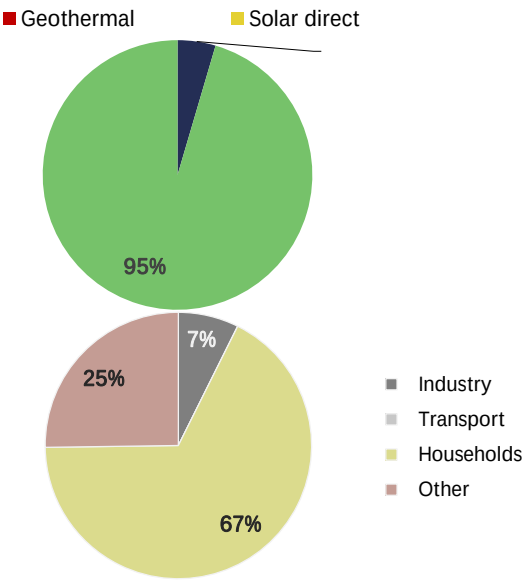
RENEWABLE ENERGY CONSUMPTION (TFEC)

Renewable TFEC trend



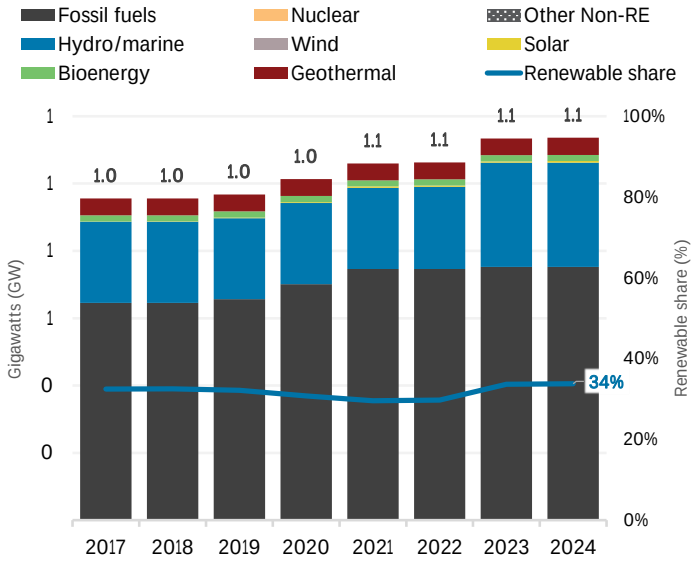
Consumption by sector	2017	2022
Industry (TJ)	5 431	5 536
Transport (TJ)	0	0
Households (TJ)	56 498	50 775
Other (TJ)	29 119	18 992

Renewable energy consumption in 2022



ELECTRICITY CAPACITY

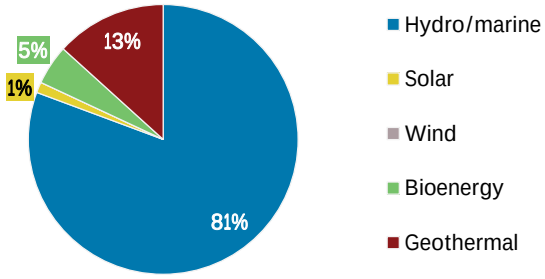
Installed capacity trend



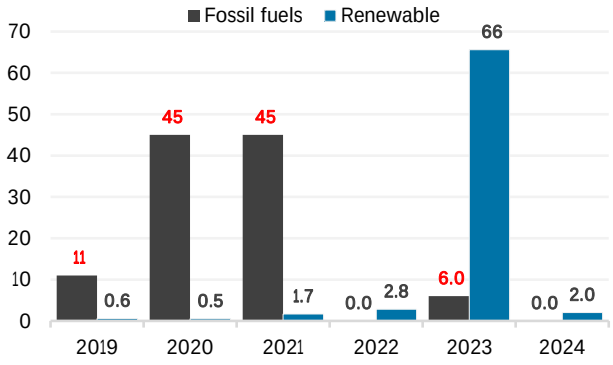
Net capacity change in 2024 (MW)

Non-renewable: 0	Hydro and marine: 0
Solar: + 1	Wind: 0
Bioenergy: 0	Geothermal: + 1

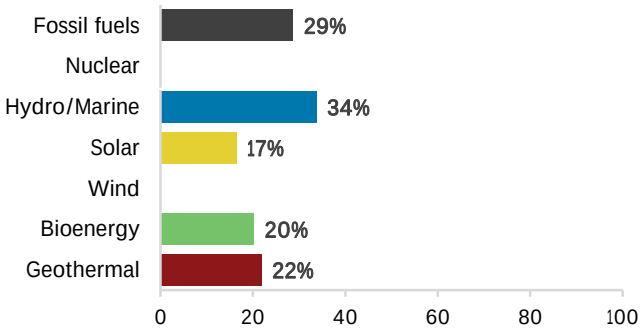
Renewable capacity in 2024



Net capacity change (MW)



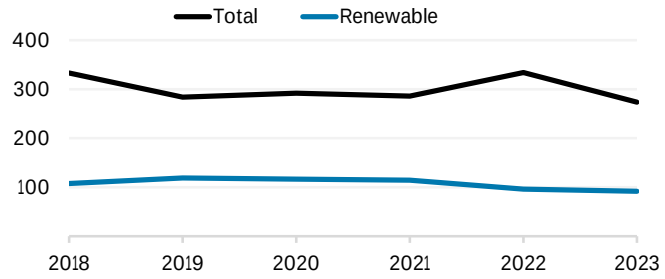
Capacity utilisation in 2023 (%)



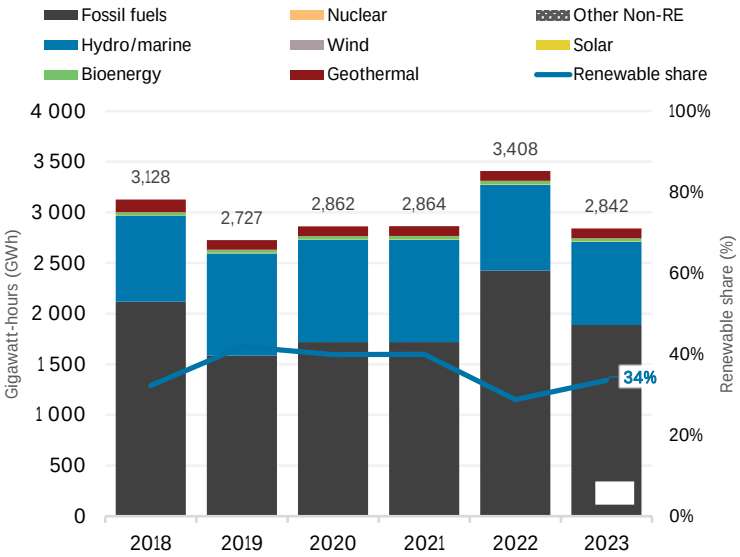
ELECTRICITY GENERATION

Generation in 2023	GWh	%
Non-renewable	**1 889**	**66**
Renewable	**953**	**34**
Hydro and marine	819	29
Solar	6	0
Wind	0	0
Bioenergy	32	1
Geothermal	96	3
Total	**2 842**	**100**

Per capita electricity generation (kWh)



Electricity generation trend

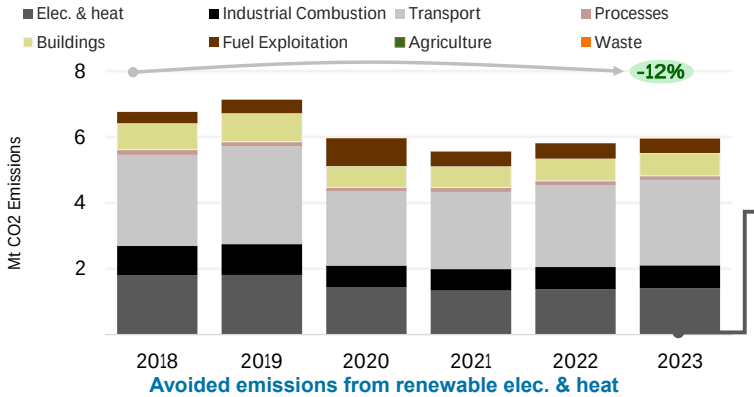


LATEST POLICIES, PROGRAMMES AND LEGISLATION

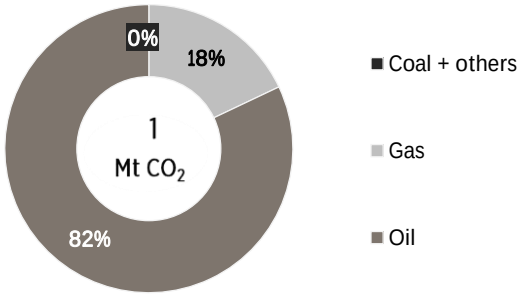
1	APEC Joint Statement on Accelerating Methane Mitigation from the LNG Value Chain	2023
2	Revised/Updated NDC of Papua New Guinea	2021
3	EITI Standard	2019
4	EU - Pacific States Interim Partnership Agreement	2009
5	Pacific Island Countries Trade Agreement (PICTA)	2003

ENERGY AND EMISSIONS

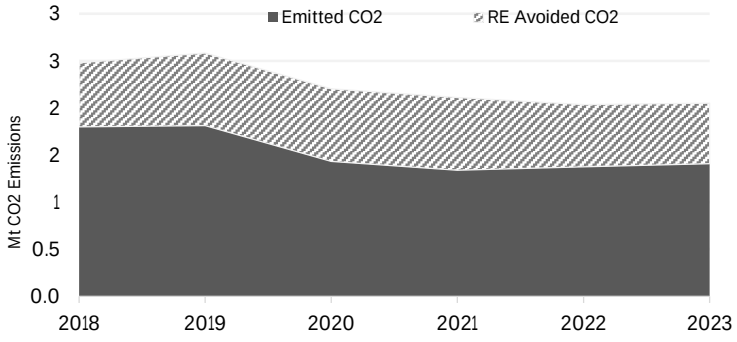
CO_2 emissions by sector



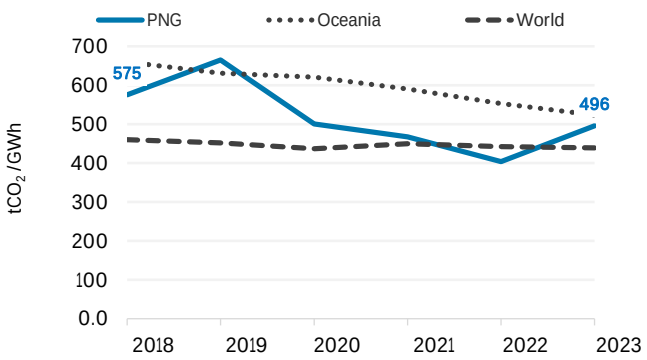
Elec. & heat generation CO_2 emissions in



Avoided emissions from renewable elec. & heat



CO_2 emission factor for elec. & heat generation

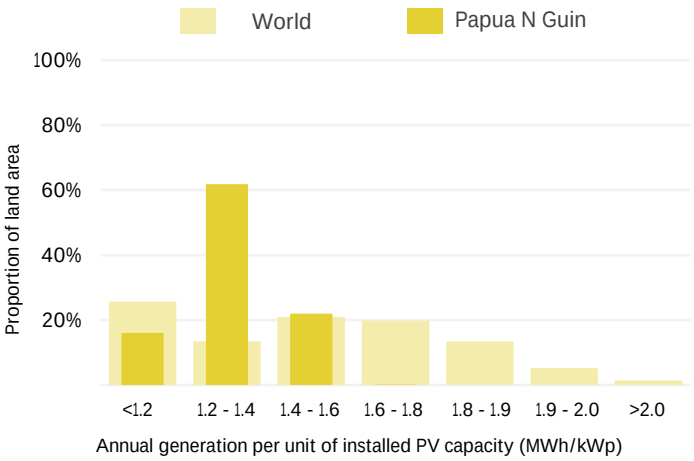


Avoided emissions based on fossil fuel mix used for power

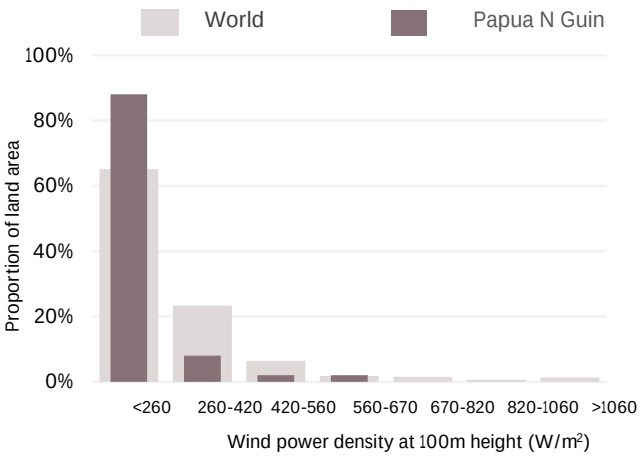
Calculated by dividing power sector emissions by elec. + heat gen.

RENEWABLE RESOURCE POTENTIAL

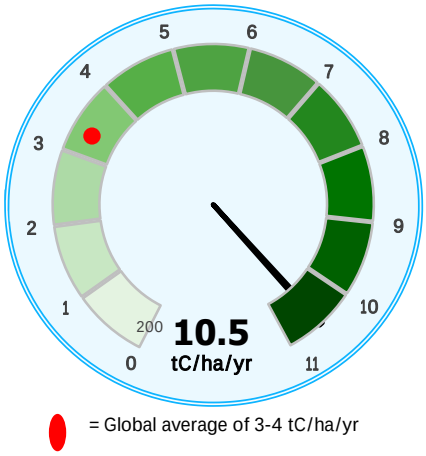
Distribution of solar potential



Distribution of wind potential



Biomass potential: net primary production



Indicators of renewable resource potential

Solar PV: Solar resource potential has been divided into seven classes, each representing a range of annual PV output per unit of capacity (kWh/kWp/yr). The bar chart shows the proportion of a country's land area in each of these classes and the global distribution of land area across the classes (for comparison).

Onshore wind: Potential wind power density (W/m²) is shown in the seven classes used by NREL, measured at a height of 100m. The bar chart shows the distribution of the country's land area in each of these classes compared to the global distribution of wind resources. Areas in the third class or above are considered to be a good wind resource.

Biomass: Net primary production (NPP) is the amount of carbon fixed by plants and accumulated as biomass each year. It is a basic measure of biomass productivity. The chart shows the average NPP in the country (tC/ha/yr), compared to the global average NPP of 3-4 tonnes of carbon

Sources: IRENA statistics, plus data from the following sources: UN SDG Database (original sources: WHO; World Bank; IEA; IRENA; and UNSD); UN World Population Prospects; UNSD Energy Balances; UN COMTRADE; World Bank World Development Indicators; EDGAR; REN21 Global Status Report; IEA-IRENA Joint Policies and Measures Database; IRENA Global Atlas; and World Bank Global Solar Atlas and Global Wind Atlas.

Additional notes: Capacity per capita and public investments SDGs only apply to developing areas. Energy self-sufficiency has been defined as total primary energy production divided by total primary energy supply. Energy trade includes all commodities in Chapter 27 of the Harmonised System (HS). Capacity utilisation is calculated as annual generation divided by year-end capacity x 8,760h/year. Avoided emissions from renewable power is calculated as renewable generation divided by fossil fuel generation multiplied by reported emissions from the power sector. This assumes that, if renewable power did not exist, fossil fuels would be used in its place to generate the same amount of power and using the same mix of fossil fuels. In countries and years where no fossil fuel generation occurs, an average fossil fuel emission factor has been used to calculate the avoided emissions.

These profiles have been produced to provide an overview of developments in renewable energy in different countries and areas. The IRENA statistics team would welcome comments and feedback on its structure and content, which can be sent to statistics@irena.org.
